Spartan-3A and Spartan-3A DSP Libraries Guide for Schematic Designs

UG614 (v 12.4) December 14, 2010

XILINX®

About this Guide

This schematic guide is part of the ISE documentation collection. A separate version of this guide is available if you prefer to work with HDL.

This guide contains the following:

- Introduction.
- A list of *retargeted elements*.
- A list of design elements supported in this architecture, organized by functional categories.
- Individual descriptions of each available primitive.

About Design Elements

This version of the Libraries Guide describes design elements available for this architecture. There are several categories of design elements:

- **Retargeted Elements -** These elements are automatically changed by the ISE software tools when they are used in this architecture. Retargeting ensures that your design takes advantage of the latest circuit design advances.
- **Primitives -** The simplest design elements in the Xilinx libraries. Primitives are the design element "atoms." Examples of Xilinx primitives are the simple buffer, BUF, and the D flip-flop with clock enable and clear, FDCE.
- **Macros -** The design element "molecules" of the Xilinx libraries. Macros can be created from the design element primitives or macros. For example, the FD4CE flip-flop macro is a composite of 4 FDCE primitives.

Xilinx maintains software libraries with hundreds of functional design elements (macros and primitives) for different device architectures. New functional elements are assembled with each release of development system software. This guide is one in a series of architecture-specific libraries.

XILINX®

Chapter 1

Design Element Retargeting

To ensure that Xilinx customers are able to take full advantage of the latest circuit design advances, certain design elements are automatically changed by the ISE software tools when they are used in this architecture.

The following table lists these elements and the more advanced elements into which they are transformed.

Original Element	Modern Equivalent
BUFGCE_1	BUFGCE + INV
BUFGDLL	DCM_SP + BUFG
BUFGMUX_1	BUFGMUX + INV
BUFGP	BUFG
CAPTURE_SPARTAN3	CAPTURE_SPARTAN3a
CLKDLL	DCM_SP
CLKDLLE	DCM_SP
CLKDLLHF	DCM_SP
FD	FDCPE
FD_1	FDCPE + INV
FDC	FDCPE
FDC_1	FDCPE + INV
FDCE	FDCPE
FDCE_1	FDCPE + INV
FDCP	FDCPE
FDCP_1	FDCPE + INV
FDE	FDCPE
FDE_1	FDCPE + INV
FDPE	FDCPE
FDPE_1	FDCPE + INV
FDR	FDRSE
FDR_1	FDRSE + INV
FDRE	FDRSE
FDRE_1	FDRSE + INV
FDRS	FDRSE

Original Element	Modern Equivalent
FDRS_1	FDRSE + INV
FDS	FDRSE
FDS_1	FDRSE + INV
FDSE	FDRSE
FDSE_1	FDRSE + INV
LD	LDCPE
LD_1	LDCPE + INV
LDC	LDCPE
LDC_1	LDCPE + INV
LDCE	LDCPE
LDCE_1	LDCPE + INV
LDE	LDCPE
LDE_1	LDCPE + INV
LDP	LDCPE
LDP_1	LDCPE + INV
LDPE	LDCPE
LDPE_1	LDCPE + INV
RAM128X1S_1	RAM128x1s + INV on clock
RAM16X1D_1	RAM16X1D + INV on clock
RAM16X1S_1	RAM16X1S + INV on clock
RAM16X2S	2=RAM16x1s
RAM16X4S	4=RAM16x1s
RAM16X8S	8=RAM16x1s
RAM32X1D_1	RAM32x1d + INV on clock
RAM32X1S_1	RAM32x1s + INV on clock
RAM32X2S	2 RAM32x1s
RAM32X4S	4 RAM32x1s
RAM32X8S	8 RAM32x1s
RAM64X1S_1	RAM64x1s + INV on clock
RAM64X2S	2 RAM64x1s
RAMB16_S1_S1	RAMB16BWE
RAMB16_S1_S18	RAMB16BWE
RAMB16_S1_S2	RAMB16BWE
RAMB16_S1_S36	RAMB16BWE
RAMB16_S1_S4	RAMB16BWE
RAMB16_S1_S9	RAMB16BWE
RAMB16_S1	RAMB16BWE
RAMB16_S18_S18	RAMB16BWE

Original Element	Modern Equivalent
RAMB16_S18_S36	RAMB16BWE
RAMB16_S18	RAMB16BWE
RAMB16_S2_S18	RAMB16BWE
RAMB16_S2_S2	RAMB16BWE
RAMB16_S2_S36	RAMB16BWE
RAMB16_S2_S4	RAMB16BWE
RAMB16_S2_S9	RAMB16BWE
RAMB16_S2	RAMB16BWE
RAMB16_S36_S36	RAMB16BWE
RAMB16_S36	RAMB16BWE
RAMB16_S4_S18	RAMB16BWE
RAMB16_S4_S36	RAMB16BWE
RAMB16_S4_S4	RAMB16BWE
RAMB16_S4_S9	RAMB16BWE
RAMB16_S4	RAMB16BWE
RAMB16_S9_S18	RAMB16BWE
RAMB16_S9_S36	RAMB16BWE
RAMB16_S9_S9	RAMB16BWE
RAMB16_S9	RAMB16BWE
RAMB4_S1_S1	RAMB16BWE
RAMB4_S1_S16	RAMB16BWE
RAMB4_S1_S2	RAMB16BWE
RAMB4_S1_S4	RAMB16BWE
RAMB4_S1_S8	RAMB16BWE
RAMB4_S1	RAMB16BWE
RAMB4_S16_S16	RAMB16BWE
RAMB4_S16	RAMB16BWE
RAMB4_S2_S16	RAMB16BWE
RAMB4_S2_S2	RAMB16BWE
RAMB4_S2_S4	RAMB16BWE
RAMB4_S2_S8	RAMB16BWE
RAMB4_S2	RAMB16BWE
RAMB4_S4_S16	RAMB16BWE
RAMB4_S4_S4	RAMB16BWE
RAMB4_S4_S8	RAMB16BWE
RAMB4_S4	RAMB16BWE
RAMB4_S8_S16	RAMB16BWE
RAMB4_S8_S8	RAMB16BWE

Original Element	Modern Equivalent
STARTUP_SPARTAN3	STARTUP_SPARTAN3a

Chapter 2

Functional Categories

This section categorizes, by function, the circuit design elements described in detail later in this guide. The elements (*primitives* and *macros*) are listed in alphanumeric order under each functional category.

Arithmetic

Design Element	Description
ACC16	Macro: 16-Bit Loadable Cascadable Accumulator with Carry-In, Carry-Out, and Synchronous Reset
ACC4	Macro: 4-Bit Loadable Cascadable Accumulator with Carry-In, Carry-Out, and Synchronous Reset
ACC8	Macro: 8-Bit Loadable Cascadable Accumulator with Carry-In, Carry-Out, and Synchronous Reset
ADD16	Macro: 16-Bit Cascadable Full Adder with Carry-In, Carry-Out, and Overflow
ADD4	Macro: 4-Bit Cascadable Full Adder with Carry-In, Carry-Out, and Overflow
ADD8	Macro: 8-Bit Cascadable Full Adder with Carry-In, Carry-Out, and Overflow
ADSU16	Macro: 16-Bit Cascadable Adder/Subtracter with Carry-In, Carry-Out, and Overflow
ADSU4	Macro: 4-Bit Cascadable Adder/Subtracter with Carry-In, Carry-Out, and Overflow
ADSU8	Macro: 8-Bit Cascadable Adder/Subtracter with Carry-In, Carry-Out, and Overflow
DSP48A	Primitive: Multi-Functional, Cascadable, 48-bit Output, Arithmetic Block
MULT18X18SIO	Primitive: 18 x 18 Cascadable Signed Multiplier with Optional Input and Output Registers, Clock Enable, and Synchronous Reset

Buffer

Design Element	Description
BUF	Primitive: General Purpose Buffer
BUFCF	Primitive: Fast Connect Buffer
BUFG	Primitive: Global Clock Buffer
BUFGCE	Primitive: Global Clock Buffer with Clock Enable
BUFGCE_1	Primitive: Global Clock Buffer with Clock Enable and Output State 1
BUFGMUX	Primitive: Global Clock MUX Buffer
BUFGMUX_1	Primitive: Global Clock MUX Buffer with Output State 1

Carry Logic

Design Element	Description
MUXCY	Primitive: 2-to-1 Multiplexer for Carry Logic with General Output
MUXCY_D	Primitive: 2-to-1 Multiplexer for Carry Logic with Dual Output
MUXCY_L	Primitive: 2-to-1 Multiplexer for Carry Logic with Local Output
XORCY	Primitive: XOR for Carry Logic with General Output
XORCY_D	Primitive: XOR for Carry Logic with Dual Output
XORCY_L	Primitive: XOR for Carry Logic with Local Output

Comparator

Design Element	Description
COMP16	Macro: 16-Bit Identity Comparator
COMP2	Macro: 2-Bit Identity Comparator
COMP4	Macro: 4-Bit Identity Comparator
COMP8	Macro: 8-Bit Identity Comparator
COMPM16	Macro: 16-Bit Magnitude Comparator
COMPM2	Macro: 2-Bit Magnitude Comparator
COMPM4	Macro: 4-Bit Magnitude Comparator
COMPM8	Macro: 8-Bit Magnitude Comparator
COMPMC16	Macro: 16-Bit Magnitude Comparator
COMPMC8	Macro: 8-Bit Magnitude Comparator

Counter

Design Element	Description
CB2CE	Macro: 2-Bit Cascadable Binary Counter with Clock Enable and Asynchronous Clear
CB2CLE	Macro: 2-Bit Loadable Cascadable Binary Counters with Clock Enable and Asynchronous Clear
CB2CLED	Macro: 2-Bit Loadable Cascadable Bidirectional Binary Counters with Clock Enable and Asynchronous Clear
CB2RE	Macro: 2-Bit Cascadable Binary Counter with Clock Enable and Synchronous Reset
CB4CE	Macro: 4-Bit Cascadable Binary Counter with Clock Enable and Asynchronous Clear
CB4CLE	Macro: 4-Bit Loadable Cascadable Binary Counters with Clock Enable and Asynchronous Clear
CB4CLED	Macro: 4-Bit Loadable Cascadable Bidirectional Binary Counters with Clock Enable and Asynchronous Clear

Design Element	Description
CB4RE	Macro: 4-Bit Cascadable Binary Counter with Clock Enable and Synchronous Reset
CC16CE	Macro: 16-Bit Cascadable Binary Counter with Clock Enable and Asynchronous Clear
CC16CLE	Macro: 16-Bit Loadable Cascadable Binary Counter with Clock Enable and Asynchronous Clear
CC16CLED	Macro: 16-Bit Loadable Cascadable Bidirectional Binary Counter with Clock Enable and Asynchronous Clear
CC16RE	Macro: 16-Bit Cascadable Binary Counter with Clock Enable and Synchronous Reset
CC8CE	Macro: 8-Bit Cascadable Binary Counter with Clock Enable and Asynchronous Clear
CC8CLE	Macro: 8-Bit Loadable Cascadable Binary Counter with Clock Enable and Asynchronous Clear
CC8CLED	Macro: 8-Bit Loadable Cascadable Bidirectional Binary Counter with Clock Enable and Asynchronous Clear
CC8RE	Macro: 8-Bit Cascadable Binary Counter with Clock Enable and Synchronous Reset
CD4CE	Macro: 4-Bit Cascadable BCD Counter with Clock Enable and Asynchronous Clear
CD4CLE	Macro: 4-Bit Loadable Cascadable BCD Counter with Clock Enable and Asynchronous Clear
CD4RE	Macro: 4-Bit Cascadable BCD Counter with Clock Enable and Synchronous Reset
CD4RLE	Macro: 4-Bit Loadable Cascadable BCD Counter with Clock Enable and Synchronous Reset
CJ4CE	4-Bit Johnson Counter with Clock Enable and Asynchronous Clear
CJ4RE	Macro: 4-Bit Johnson Counter with Clock Enable and Synchronous Reset
CJ5CE	Macro: 5-Bit Johnson Counter with Clock Enable and Asynchronous Clear
CJ5RE	Macro: 5-Bit Johnson Counter with Clock Enable and Synchronous Reset
CJ8CE	Macro: 8-Bit Johnson Counter with Clock Enable and Asynchronous Clear
CJ8RE	Macro: 8-Bit Johnson Counter with Clock Enable and Synchronous Reset

DDR Flip Flop

Design Element	Description
IDDR2	Primitive: Double Data Rate Input D Flip-Flop with Optional Data Alignment, Clock Enable and Programmable Synchronous or Asynchronous Set/Reset
ODDR2	Primitive: Dual Data Rate Output D Flip-Flop with Optional Data Alignment, Clock Enable and Programmable Synchronous or Asynchronous Set/Reset

Decoder

Design Element	Description
D2_4E	Macro: 2- to 4-Line Decoder/Demultiplexer with Enable
D3_8E	Macro: 3- to 8-Line Decoder/Demultiplexer with Enable
D4_16E	Macro: 4- to 16-Line Decoder/Demultiplexer with Enable
DEC_CC16	Macro: 16-Bit Active Low Decoder
DEC_CC4	Macro: 4-Bit Active Low Decoder
DEC_CC8	Macro: 8-Bit Active Low Decoder
DECODE16	Macro: 16-Bit Active-Low Decoder
DECODE32	Macro: 32-Bit Active-Low Decoder
DECODE4	Macro: 4-Bit Active-Low Decoder
DECODE64	Macro: 64-Bit Active-Low Decoder
DECODE8	Macro: 8-Bit Active-Low Decoder

Flip Flop

Design Element	Description
IDDR2	Primitive: Double Data Rate Input D Flip-Flop with Optional Data Alignment, Clock Enable and Programmable Synchronous or Asynchronous Set/Reset
ODDR2	Primitive: Dual Data Rate Output D Flip-Flop with Optional Data Alignment, Clock Enable and Programmable Synchronous or Asynchronous Set/Reset

General

Design Element	Description
BSCAN_SPARTAN3A	Primitive: Spartan®-3A JTAG Boundary Scan Logic Access Circuit
CAPTURE_SPARTAN3A	Primitive: Spartan®-3A Register State Capture for Bitstream Readback
DNA_PORT	Primitive: Device DNA Data Access Port
DCM_SP	Primitive: Digital Clock Manager
GND	Primitive: Ground-Connection Signal Tag
ICAP_SPARTAN3A	Primitive: Internal Configuration Access Port
KEEPER	Primitive: KEEPER Symbol
PULLDOWN	Primitive: Resistor to GND for Input Pads, Open-Drain, and 3-State Outputs
PULLUP	Primitive: Resistor to VCC for Input PADs, Open-Drain, and 3-State Outputs
STARTUP_SPARTAN3A	Primitive: Spartan®-3A Global Set/Reset, Global 3-State and Configuration Start-Up Clock Interface
VCC	Primitive: VCC-Connection Signal Tag

IO

Design Element	Description
IBUF	Primitive: Input Buffer
IBUF_DLY_ADJ	Primitive: Dynamically Adjustable Input Delay Buffer
IBUFDS	Primitive: Differential Signaling Input Buffer
IBUFDS_DLY_ADJ	Primitive: Dynamically Adjustable Differential Input Delay Buffer
IBUF16	Macro: 16-Bit Input Buffer
IBUF4	Macro: 4-Bit Input Buffer
IBUF8	Macro: 8-Bit Input Buffer
IBUFG	Primitive: Dedicated Input Clock Buffer
IBUFGDS	Primitive: Differential Signaling Dedicated Input Clock Buffer and Optional Delay
IOBUF	Primitive: Bi-Directional Buffer
IOBUFDS	Primitive: 3-State Differential Signaling I/O Buffer with Active Low Output Enable
OBUF	Primitive: Output Buffer
OBUF16	Macro: 16-Bit Output Buffer
OBUF8	Macro: 8-Bit Output Buffer
OBUF4	Macro: 4-Bit Output Buffer
OBUFDS	Primitive: Differential Signaling Output Buffer
OBUFT	Primitive: 3-State Output Buffer with Active Low Output Enable
OBUFT4	Macro: 4-Bit 3-State Output Buffers with Active-Low Output Enable
OBUFT8	Macro: 8-Bit 3-State Output Buffers with Active-Low Output Enable
OBUFT16	Macro: 16-Bit 3-State Output Buffer with Active Low Output Enable
OBUFTDS	Primitive: 3-State Output Buffer with Differential Signaling, Active-Low Output Enable

IO FlipFlop

Design Element	Description
IFD	Macro: Input D Flip-Flop
IFD_1	Macro: Input D Flip-Flop with Inverted Clock (Asynchronous Preset)
IFD16	Macro: 16-Bit Input D Flip-Flop
IFD4	Macro: 4-Bit Input D Flip-Flop
IFD8	Macro: 8-Bit Input D Flip-Flop
IFDI	Macro: Input D Flip-Flop (Asynchronous Preset)

Design Element	Description
IFDI_1	Macro: Input D Flip-Flop with Inverted Clock (Asynchronous Preset)
IFDX	Macro: Input D Flip-Flop with Clock Enable
IFDX_1	Macro: Input D Flip-Flop with Inverted Clock and Clock Enable
IFDX16	Macro: 16-Bit Input D Flip-Flops with Clock Enable
IFDX4	Macro: 4-Bit Input D Flip-Flop with Clock Enable
IFDX8	Macro: 8-Bit Input D Flip-Flop with Clock Enable
IFDXI	Macro: Input D Flip-Flop with Clock Enable (Asynchronous Preset)
IFDXI_1	Macro: Input D Flip-Flop with Inverted Clock and Clock Enable (Asynchronous Preset)
OFD	Macro: Output D Flip-Flop
OFD_1	Macro: Output D Flip-Flop with Inverted Clock
OFD16	Macro: 16-Bit Output D Flip-Flop
OFD4	Macro: 4-Bit Output D Flip-Flop
OFD8	Macro: 8-Bit Output D Flip-Flop
OFDE	Macro: D Flip-Flop with Active-High Enable Output Buffers
OFDE_1	Macro: D Flip-Flop with Active-High Enable Output Buffer and Inverted Clock
OFDE16	Macro: 16-Bit D Flip-Flop with Active-High Enable Output Buffers
OFDE4	Macro: 4-Bit D Flip-Flop with Active-High Enable Output Buffers
OFDE8	Macro: 8-Bit D Flip-Flop with Active-High Enable Output Buffers
OFDI	Macro: Output D Flip-Flop (Asynchronous Preset)
OFDI_1	Macro: Output D Flip-Flop with Inverted Clock (Asynchronous Preset)
OFDT	Macro: D Flip-Flop with Active-Low 3-State Output Buffer
OFDT_1	Macro: D Flip-Flop with Active-Low 3-State Output Buffer and Inverted Clock
OFDT16	Macro: 16-Bit D Flip-Flop with Active-Low 3-State Output Buffers
OFDT4	Macro: 4-Bit D Flip-Flop with Active-Low 3-State Output Buffers
OFDT8	Macro: 8-Bit D Flip-Flop with Active-Low 3-State Output Buffers
OFDX	Macro: Output D Flip-Flop with Clock Enable
OFDX_1	Macro: Output D Flip-Flop with Inverted Clock and Clock Enable
OFDX16	Macro: 16-Bit Output D Flip-Flop with Clock Enable
OFDX4	Macro: 4-Bit Output D Flip-Flop with Clock Enable

Design Element	Description
OFDX8	Macro: 8-Bit Output D Flip-Flop with Clock Enable
OFDXI	Macro: Output D Flip-Flop with Clock Enable (Asynchronous Preset)
OFDXI_1	Macro: Output D Flip-Flop with Inverted Clock and Clock Enable (Asynchronous Preset)

IO Latch

Design Element	Description
ILD	Macro: Transparent Input Data Latch
ILD_1	Macro: Transparent Input Data Latch with Inverted Gate
ILD16	Macro: Transparent Input Data Latch
ILD4	Macro: Transparent Input Data Latch
ILD8	Macro: Transparent Input Data Latch
ILDI	Macro: Transparent Input Data Latch (Asynchronous Preset)
ILDI_1	Macro: Transparent Input Data Latch with Inverted Gate (Asynchronous Preset)
ILDX	Macro: Transparent Input Data Latch
ILDX_1	Macro: Transparent Input Data Latch with Inverted Gate
ILDX16	Macro: Transparent Input Data Latch
ILDX4	Macro: Transparent Input Data Latch
ILDX8	Macro: Transparent Input Data Latch
ILDXI	Macro: Transparent Input Data Latch (Asynchronous Preset)
ILDXI_1	Macro: Transparent Input Data Latch with Inverted Gate (Asynchronous Preset)

Latch

Design Element	Description
ILD	Macro: Transparent Input Data Latch
ILD_1	Macro: Transparent Input Data Latch with Inverted Gate
ILD16	Macro: Transparent Input Data Latch
ILD4	Macro: Transparent Input Data Latch
ILD8	Macro: Transparent Input Data Latch
ILDI	Macro: Transparent Input Data Latch (Asynchronous Preset)
ILDI_1	Macro: Transparent Input Data Latch with Inverted Gate (Asynchronous Preset)
ILDX	Macro: Transparent Input Data Latch
ILDX_1	Macro: Transparent Input Data Latch with Inverted Gate
ILDX16	Macro: Transparent Input Data Latch
ILDX4	Macro: Transparent Input Data Latch
ILDX8	Macro: Transparent Input Data Latch
ILDXI	Macro: Transparent Input Data Latch (Asynchronous Preset)
ILDXI_1	Macro: Transparent Input Data Latch with Inverted Gate (Asynchronous Preset)

Logic

Design Element	Description
MUXCY	Primitive: 2-to-1 Multiplexer for Carry Logic with General Output
MUXCY_D	Primitive: 2-to-1 Multiplexer for Carry Logic with Dual Output
MUXCY_L	Primitive: 2-to-1 Multiplexer for Carry Logic with Local Output
XORCY	Primitive: XOR for Carry Logic with General Output
XORCY_D	Primitive: XOR for Carry Logic with Dual Output
XORCY_L	Primitive: XOR for Carry Logic with Local Output

LUT

Design Element	Description
LUT1	Primitive: 1-Bit Look-Up Table with General Output
LUT1_D	Primitive: 1-Bit Look-Up Table with Dual Output
LUT1_L	Primitive: 1-Bit Look-Up Table with Local Output
LUT2	Primitive: 2-Bit Look-Up Table with General Output
LUT2_D	Primitive: 2-Bit Look-Up Table with Dual Output
LUT2_L	Primitive: 2-Bit Look-Up Table with Local Output
LUT3	Primitive: 3-Bit Look-Up Table with General Output
LUT3_D	Primitive: 3-Bit Look-Up Table with Dual Output
LUT3_L	Primitive: 3-Bit Look-Up Table with Local Output
LUT4	Primitive: 4-Bit Look-Up-Table with General Output
LUT4_D	Primitive: 4-Bit Look-Up Table with Dual Output
LUT4_L	Primitive: 4-Bit Look-Up Table with Local Output

Memory

Design Element	Description
RAM16X1D	Primitive: 16-Deep by 1-Wide Static Dual Port Synchronous RAM
RAM16X1D_1	Primitive: 16-Deep by 1-Wide Static Dual Port Synchronous RAM with Negative-Edge Clock
RAM16X1S	Primitive: 16-Deep by 1-Wide Static Synchronous RAM
RAM16X1S_1	Primitive: 16-Deep by 1-Wide Static Synchronous RAM with Negative-Edge Clock
RAM16X2S	Primitive: 16-Deep by 2-Wide Static Synchronous RAM
RAM16X4S	Primitive: 16-Deep by 4-Wide Static Synchronous RAM
RAM16X8S	Primitive: 16-Deep by 8-Wide Static Synchronous RAM
RAM32X1S	Primitive: 32-Deep by 1-Wide Static Synchronous RAM
RAM32X1S_1	Primitive: 32-Deep by 1-Wide Static Synchronous RAM with Negative-Edge Clock
RAM32X2S	Primitive: 32-Deep by 2-Wide Static Synchronous RAM
RAM32X4S	Primitive: 32-Deep by 4-Wide Static Synchronous RAM
RAM32X8S	Primitive: 32-Deep by 8-Wide Static Synchronous RAM
RAM64X1S	Primitive: 64-Deep by 1-Wide Static Synchronous RAM
RAM64X1S_1	Primitive: 64-Deep by 1-Wide Static Synchronous RAM with Negative-Edge Clock
RAM64X2S	Primitive: 64-Deep by 2-Wide Static Synchronous RAM
RAMB16BWER	Primitive: 16K-bit Data and 2K-bit Parity Configurable Synchronous Dual Port Block RAM with Optional Output Registers

Design Element	Description
RAMB16_S1	Primitive: 16K-bit Data and 2K-bit Parity Single-Port Synchronous Block RAM with 1-bit Port
RAMB16_S1_S1	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 1-bit Ports
RAMB16_S1_S18	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 1-bit and 18-bit Ports
RAMB16_S1_S2	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 1-bit and 2-bit Ports
RAMB16_S1_S4	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 1-bit and 4-bit Ports
RAMB16_S1_S9	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 1-bit and 9-bit Ports
RAMB16_S2	Primitive: 16K-bit Data and 2K-bit Parity Single-Port Synchronous Block RAM with 2-bit Port
RAMB16_S2_S18	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 2-bit and 18-bit Ports
RAMB16_S2_S2	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 2-bit Ports
RAMB16_S2_S4	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 2-bit and 4-bit Ports
RAMB16_S2_S9	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 2-bit and 9-bit Ports
RAMB16_S4	Primitive: 16K-bit Data and 2K-bit Parity Single-Port Synchronous Block RAM with 4-bit Port
RAMB16_S4_S18	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 4-bit and 18-bit Ports
RAMB16_S4_S4	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 4-bit Ports
RAMB16_S4_S9	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 4-bit and 9-bit Ports
RAMB16_S9	Primitive: 16K-bit Data and 2K-bit Parity Single-Port Synchronous Block RAM with 9-bit Port
RAMB16_S9_S9	Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 9-bit Ports
RAMB16BWE	Primitive: 16K-bit Data and 2K-bit Parity Configurable Synchronous Dual Port Block RAM
RAMB16BWE_S18	Primitive: 16K-bit Data and 2K-bit Parity Synchronous Single Port Block RAM with 18-bit Port
RAMB16BWE_S18_S9	Primitive: 16K-bit Data and 2K-bit Parity Synchronous Dual Port Block RAM with 18-bit and 9-bit Ports
RAMB16BWE_S18_S18	Primitive: 16K-bit Data and 2K-bit Parity Synchronous Dual Port Block RAM with 18-bit Ports
RAMB16BWE_S36	Primitive: 16K-bit Data and 2K-bit Parity Synchronous Single Port Block RAM with 36-Bit Port
RAMB16BWE_S36_S9	Primitive: 16K-bit Data and 2K-bit Parity Synchronous Dual Port Block RAM with 36-bit and 9-bit Ports
RAMB16BWE_S36_S18	Primitive: 16K-bit Data and 2K-bit Parity Synchronous Dual Port Block RAM with 36-bit and 18-bit Ports

Design Element	Description
RAMB16BWE_S36_S36	Primitive: 16K-bit Data and 2K-bit Parity Synchronous Dual Port Block RAM with 36-bit Ports
ROM16X1	Primitive: 16-Deep by 1-Wide ROM
ROM32X1	Primitive: 32-Deep by 1-Wide ROM
ROM64X1	Primitive: 64-Deep by 1-Wide ROM
ROM128X1	Primitive: 128-Deep by 1-Wide ROM
ROM256X1	Primitive: 256-Deep by 1-Wide ROM

Mux

Design Element	Description
M16_1E	Macro: 16-to-1 Multiplexer with Enable
M2_1	Macro: 2-to-1 Multiplexer
M2_1B1	Macro: 2-to-1 Multiplexer with D0 Inverted
M2_1B2	Macro: 2-to-1 Multiplexer with D0 and D1 Inverted
M2_1E	Macro: 2-to-1 Multiplexer with Enable
M4_1E	Macro: 4-to-1 Multiplexer with Enable
M8_1E	Macro: 8-to-1 Multiplexer with Enable
MUXF5	Primitive: 2-to-1 Look-Up Table Multiplexer with General Output
MUXF5_D	Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output
MUXF5_L	Primitive: 2-to-1 Look-Up Table Multiplexer with Local Output
MUXF6	Primitive: 2-to-1 Look-Up Table Multiplexer with General Output
MUXF6_D	Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output
MUXF6_L	Primitive: 2-to-1 Look-Up Table Multiplexer with Local Output
MUXF7	Primitive: 2-to-1 Look-Up Table Multiplexer with General Output
MUXF7_D	Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output
MUXF7_L	Primitive: 2-to-1 look-up table Multiplexer with Local Output
MUXF8	Primitive: 2-to-1 Look-Up Table Multiplexer with General Output
MUXF8_D	Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output
MUXF8_L	Primitive: 2-to-1 Look-Up Table Multiplexer with Local Output

Shift Register

Design Element	Description
SR16CE	Macro: 16-Bit Serial-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear
SR16CLE	Macro: 16-Bit Loadable Serial/Parallel-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear
SR16CLED	Macro: 16-Bit Shift Register with Clock Enable and Asynchronous Clear
SR16RE	Macro: 16-Bit Serial-In Parallel-Out Shift Register with Clock Enable and Synchronous Reset
SR16RLE	Macro: 16-Bit Loadable Serial/Parallel-In Parallel-Out Shift Register with Clock Enable and Synchronous Reset
SR16RLED	Macro: 16-Bit Shift Register with Clock Enable and Synchronous Reset
SR4CE	Macro: 4-Bit Serial-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear
SR4CLE	Macro: 4-Bit Loadable Serial/Parallel-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear
SR4CLED	Macro: 4-Bit Shift Register with Clock Enable and Asynchronous Clear
SR4RE	Macro: 4-Bit Serial-In Parallel-Out Shift Register with Clock Enable and Synchronous Reset
SR4RLE	Macro: 4-Bit Loadable Serial/Parallel-In Parallel-Out Shift Register with Clock Enable and Synchronous Reset
SR4RLED	Macro: 4-Bit Shift Register with Clock Enable and Synchronous Reset
SR8CE	Macro: 8-Bit Serial-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear
SR8CLE	Macro: 8-Bit Loadable Serial/Parallel-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear
SR8CLED	Macro: 8-Bit Shift Register with Clock Enable and Asynchronous Clear
SR8RE	Macro: 8-Bit Serial-In Parallel-Out Shift Register with Clock Enable and Synchronous Reset

Chapter 3

About Design Elements

This section describes the design elements that can be used with this architecture. The design elements are organized alphabetically.

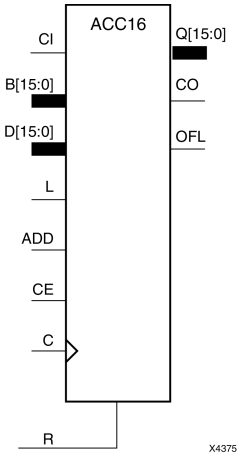
The following information is provided for each design element, where applicable:

- Name of element
- Brief description
- Schematic symbol (if any)
- Logic Table (if any)
- Port Descriptions (if any)
- Design Entry Method
- Available Attributes (if any)
- For more information

You can find examples of VHDL and Verilog instantiation code in the ISE software (in the main menu, select **Edit > Language Templates** or in the *Libraries Guide for HDL Designs* for this architecture.

ACC16

Macro: 16-Bit Loadable Cascadable Accumulator with Carry-In, Carry-Out, and Synchronous Reset



Introduction

This design element can add or subtract a 16-bit unsigned-binary, respectively or two's-complement word to or from the contents of a 16-bit data register and store the results in the register. The register can be loaded with the 16-bit word.

When the load input (L) is High, CE is ignored and the data on the D inputs is loaded into the register during the Low-to-High clock (C) transition. ACC16 loads the data on inputs D15 : D0 into the 16-bit register.

This design element operates on either 16-bit unsigned binary numbers or 16-bit two's-complement numbers. If the inputs are interpreted as unsigned binary, the result can be interpreted as unsigned binary. If the inputs are interpreted as two's complement, the output can be interpreted as two's complement. The only functional difference between an unsigned binary operation and a two's-complement operation is how they determine when "overflow" occurs. Unsigned binary uses carry-out (CO), while two's complement uses OFL to determine when "overflow" occurs.

- For unsigned binary operation, ACC16 can represent numbers between 0 and 15, inclusive. In add mode, CO is active (High) when the sum exceeds the bounds of the adder/subtracter. In subtract mode, CO is an active-Low borrow-out and goes Low when the difference exceeds the bounds. The carry-out (CO) is not registered synchronously with the data outputs. CO always reflects the accumulation of the B inputs (B15 : B0 for ACC16). This allows the cascading of ACC16s by connecting CO of one stage to CI of the next stage. An unsigned binary "overflow" that is always active-High can be generated by gating the ADD signal and CO as follows:

  ```
  unsigned overflow = CO XOR ADD
  ```

  Ignore OFL in unsigned binary operation.

- For two's-complement operation, ACC16 represents numbers between -8 and +7, inclusive. If an addition or subtraction operation result exceeds this range, the OFL output goes High. The overflow (OFL) is not registered synchronously with the data outputs. OFL always reflects the accumulation of the B inputs (B15 : B0 for ACC16) and the contents of the register, which allows cascading of ACC4s by connecting OFL of one stage to CI of the next stage.

  Ignore CO in two's-complement operation.

The synchronous reset (R) has priority over all other inputs, and when set to High, causes all outputs to go to logic level zero during the Low-to-High clock (C) transition. Clock (C) transitions are ignored when clock enable (CE) is Low.

This design element is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Input						Output
R	**L**	**CE**	**ADD**	**D**	**C**	**Q**
1	x	x	x	x	↑	0
0	1	x	x	Dn	↑	Dn
0	0	1	1	x	↑	Q0+Bn+CI
0	0	1	0	x	↑	Q0-Bn-CI
0	0	0	x	x	↑	No Change

Q0: Previous value of Q

Bn: Value of Data input B

CI: Value of input CI

Design Entry Method

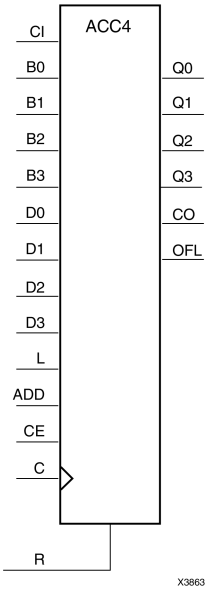
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ACC4

Macro: 4-Bit Loadable Cascadable Accumulator with Carry-In, Carry-Out, and Synchronous Reset



Introduction

This design element can add or subtract a 4-bit unsigned-binary, respectively or two's-complement word to or from the contents of a 4-bit data register and store the results in the register. The register can be loaded with the 4-bit word.

When the load input (L) is High, CE is ignored and the data on the D inputs is loaded into the register during the Low-to-High clock (C) transition. ACC4 loads the data on inputs D3 : D0 into the 4-bit register.

This design element operates on either 4-bit unsigned binary numbers or 4-bit two's-complement numbers. If the inputs are interpreted as unsigned binary, the result can be interpreted as unsigned binary. If the inputs are interpreted as two's complement, the output can be interpreted as two's complement. The only functional difference between an unsigned binary operation and a two's-complement operation is how they determine when "overflow" occurs. Unsigned binary uses carry-out (CO), while two's complement uses OFL to determine when "overflow" occurs.

- For unsigned binary operation, ACC4 can represent numbers between 0 and 15, inclusive. In add mode, CO is active (High) when the sum exceeds the bounds of the adder/subtracter. In subtract mode, CO is an active-Low borrow-out and goes Low when the difference exceeds the bounds. The carry-out (CO) is not registered synchronously with the data outputs. CO always reflects the accumulation of the B inputs (B3 : B0 for ACC4). This allows the cascading of ACC4s by connecting CO of one stage to CI of the next stage. An unsigned binary "overflow" that is always active-High can be generated by gating the ADD signal and CO as follows:

  ```
  unsigned overflow = CO XOR ADD
  ```

  Ignore OFL in unsigned binary operation.

- For two's-complement operation, ACC4 represents numbers between -8 and +7, inclusive. If an addition or subtraction operation result exceeds this range, the OFL output goes High. The overflow (OFL) is not registered synchronously with the data outputs. OFL always reflects the accumulation of the B inputs (B3 : B0 for ACC4) and the contents of the register, which allows cascading of ACC4s by connecting OFL of one stage to CI of the next stage.

  Ignore CO in two's-complement operation.

The synchronous reset (R) has priority over all other inputs, and when set to High, causes all outputs to go to logic level zero during the Low-to-High clock (C) transition. Clock (C) transitions are ignored when clock enable (CE) is Low.

This design element is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Input						Output
R	**L**	**CE**	**ADD**	**D**	**C**	**Q**
1	x	x	x	x	↑	0
0	1	x	x	Dn	↑	Dn
0	0	1	1	x	↑	Q0+Bn+CI
0	0	1	0	x	↑	Q0-Bn-CI
0	0	0	x	x	↑	No Change

Q0: Previous value of Q

Bn: Value of Data input B

CI: Value of input CI

Design Entry Method

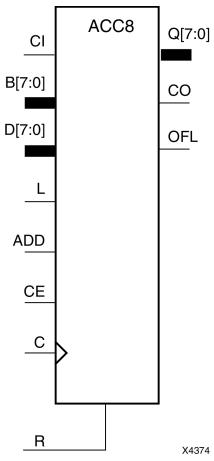
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ACC8

Macro: 8-Bit Loadable Cascadable Accumulator with Carry-In, Carry-Out, and Synchronous Reset



Introduction

This design element can add or subtract a 8-bit unsigned-binary, respectively or two's-complement word to or from the contents of a 8-bit data register and store the results in the register. The register can be loaded with the 8-bit word.

When the load input (L) is High, CE is ignored and the data on the D inputs is loaded into the register during the Low-to-High clock (C) transition. ACC8 loads the data on inputs D7 : D0 into the 8-bit register.

This design element operates on either 8-bit unsigned binary numbers or 8-bit two's-complement numbers. If the inputs are interpreted as unsigned binary, the result can be interpreted as unsigned binary. If the inputs are interpreted as two's complement, the output can be interpreted as two's complement. The only functional difference between an unsigned binary operation and a two's-complement operation is how they determine when "overflow" occurs. Unsigned binary uses carry-out (CO), while two's complement uses OFL to determine when "overflow" occurs.

- For unsigned binary operation, ACC8 can represent numbers between 0 and 255, inclusive. In add mode, CO is active (High) when the sum exceeds the bounds of the adder/subtracter. In subtract mode, CO is an active-Low borrow-out and goes Low when the difference exceeds the bounds. The carry-out (CO) is not registered synchronously with the data outputs. CO always reflects the accumulation of the B inputs (B3 : B0 for ACC4). This allows the cascading of ACC8s by connecting CO of one stage to CI of the next stage. An unsigned binary "overflow" that is always active-High can be generated by gating the ADD signal and CO as follows:

  ```
  unsigned overflow = CO XOR ADD
  ```

  Ignore OFL in unsigned binary operation.

- For two's-complement operation, ACC8 represents numbers between -128 and +127, inclusive. If an addition or subtraction operation result exceeds this range, the OFL output goes High. The overflow (OFL) is not registered synchronously with the data outputs. OFL always reflects the accumulation of the B inputs (B3 : B0 for ACC8) and the contents of the register, which allows cascading of ACC8s by connecting OFL of one stage to CI of the next stage.

  Ignore CO in two's-complement operation.

The synchronous reset (R) has priority over all other inputs, and when set to High, causes all outputs to go to logic level zero during the Low-to-High clock (C) transition. Clock (C) transitions are ignored when clock enable (CE) is Low.

This design element is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Input						Output
R	**L**	**CE**	**ADD**	**D**	**C**	**Q**
1	x	x	x	x	↑	0
0	1	x	x	Dn	↑	Dn
0	0	1	1	x	↑	Q0+Bn+CI
0	0	1	0	x	↑	Q0-Bn-CI
0	0	0	x	x	↑	No Change
Q0: Previous value of Q Bn: Value of Data input B CI: Value of input CI						

Design Entry Method

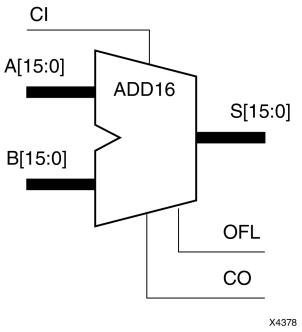
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ADD16

Macro: 16-Bit Cascadable Full Adder with Carry-In, Carry-Out, and Overflow



Introduction

This design element adds two words and a carry-in (CI), producing a sum output and carry-out (CO) or overflow (OFL). The factors added are A15:A0, B15:B0 and CI, producing the sum output S15:S0 and CO (or OFL).

Logic Table

Input		Output
A	**B**	**S**
An	Bn	An+Bn+CI
CI: Value of input CI.		

Unsigned Binary Versus Two's Complement -This design element can operate on either 16-bit unsigned binary numbers or 16-bit two's-complement numbers, respectively. If the inputs are interpreted as unsigned binary, the result can be interpreted as unsigned binary. If the inputs are interpreted as two's complement, the output can be interpreted as two's complement. The only functional difference between an unsigned binary operation and a two's-complement operation is the way they determine when "overflow" occurs. Unsigned binary uses CO, while two's-complement uses OFL to determine when "overflow" occurs. To interpret the inputs as unsigned binary, follow the CO output. To interpret the inputs as two's complement, follow the OFL output.

Unsigned Binary Operation -For unsigned binary operation, this element represents numbers between 0 and 65535, inclusive. OFL is ignored in unsigned binary operation.

Two's-Complement Operation -For two's-complement operation, this element can represent numbers between -32768 and +32767, inclusive. OFL is active (High) when the sum exceeds the bounds of the adder. CO is ignored in two's-complement operation.

Design Entry Method

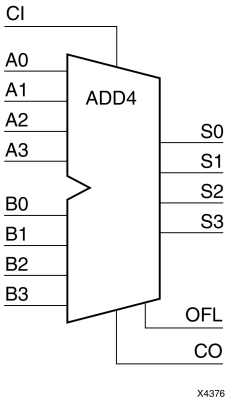
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ADD4

Macro: 4-Bit Cascadable Full Adder with Carry-In, Carry-Out, and Overflow



Introduction

This design element adds two words and a carry-in (CI), producing a sum output and carry-out (CO) or overflow (OFL). The factors added are A3:A0, B3:B0, and CI producing the sum output S3:S0 and CO (or OFL).

Logic Table

Input		Output
A	**B**	**S**
An	Bn	An+Bn+CI
CI: Value of input CI.		

Unsigned Binary Versus Two's Complement -This design element can operate on either 4-bit unsigned binary numbers or 4-bit two's-complement numbers, respectively. If the inputs are interpreted as unsigned binary, the result can be interpreted as unsigned binary. If the inputs are interpreted as two's complement, the output can be interpreted as two's complement. The only functional difference between an unsigned binary operation and a two's-complement operation is the way they determine when "overflow" occurs. Unsigned binary uses CO, while two's-complement uses OFL to determine when "overflow" occurs. To interpret the inputs as unsigned binary, follow the CO output. To interpret the inputs as two's complement, follow the OFL output.

Unsigned Binary Operation -For unsigned binary operation, this element represents numbers from 0 to 15, inclusive. OFL is ignored in unsigned binary operation.

Two's-Complement Operation -For two's-complement operation, this element can represent numbers between -8 and +7, inclusive. OFL is active (High) when the sum exceeds the bounds of the adder. CO is ignored in two's-complement operation.

Design Entry Method

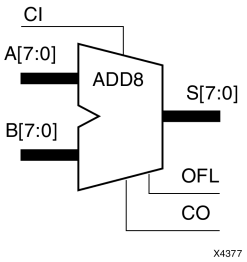
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ADD8

Macro: 8-Bit Cascadable Full Adder with Carry-In, Carry-Out, and Overflow



Introduction

This design element adds two words and a carry-in (CI), producing a sum output and carry-out (CO) or overflow (OFL). The factors added are A7:A0, B7:B0, and CI, producing the sum output S7:S0 and CO (or OFL).

Logic Table

Input		Output
A	**B**	**S**
An	Bn	An+Bn+CI
CI: Value of input CI.		

Unsigned Binary Versus Two's Complement -This design element can operate on either 8-bit unsigned binary numbers or 8-bit two's-complement numbers, respectively. If the inputs are interpreted as unsigned binary, the result can be interpreted as unsigned binary. If the inputs are interpreted as two's complement, the output can be interpreted as two's complement. The only functional difference between an unsigned binary operation and a two's-complement operation is the way they determine when "overflow" occurs. Unsigned binary uses CO, while two's-complement uses OFL to determine when "overflow" occurs. To interpret the inputs as unsigned binary, follow the CO output. To interpret the inputs as two's complement, follow the OFL output.

Unsigned Binary Operation -For unsigned binary operation, this element represents numbers between 0 and 255, inclusive. OFL is ignored in unsigned binary operation.

Two's-Complement Operation -For two's-complement operation, this element can represent numbers between -128 and +127, inclusive. OFL is active (High) when the sum exceeds the bounds of the adder. CO is ignored in two's-complement operation.

Design Entry Method

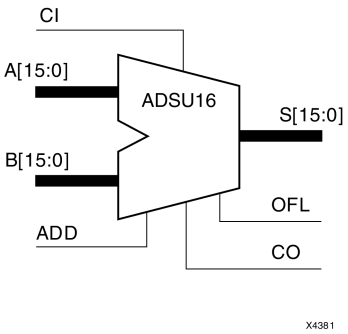
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ADSU16

Macro: 16-Bit Cascadable Adder/Subtracter with Carry-In, Carry-Out, and Overflow



Introduction

When the ADD input is High, this element adds two 16-bit words (A15:A0 and B15:B0) and a carry-in (CI), producing a 16-bit sum output (S15:S0) and carry-out (CO) or overflow (OFL).

When the ADD input is Low, this element subtracts B15:B0 from A15:A0, producing a difference output and a carry-out (CO) or an overflow (OFL).

In add mode, CO and CI are active-High. In subtract mode, CO and CI are active-Low. OFL is active-High in add and subtract modes.

Logic Table

Input			Output
ADD	**A**	**B**	**S**
1	An	Bn	An+Bn+CI*
0	An	Bn	An-Bn-CI*
CI*: ADD = 0, CI, CO active LOW CI*: ADD = 1, CI, CO active HIGH			

Unsigned Binary Versus Two's Complement -This design element can operate on either 16-bit unsigned binary numbers or 16-bit two's-complement numbers. If the inputs are interpreted as unsigned binary, the result can be interpreted as unsigned binary. If the inputs are interpreted as two's complement, the output can be interpreted as two's complement. The only functional difference between an unsigned binary operation and a two's-complement operation is the way they determine when "overflow" occurs. Unsigned binary uses CO, while two's complement uses OFL to determine when "overflow" occurs.

With adder/subtracters, either unsigned binary or two's-complement operations cause an overflow. If the result crosses the overflow boundary, an overflow is generated. Similarly, when the result crosses the carry-out boundary, a carry-out is generated.

Unsigned Binary Operation -For unsigned binary operation, this element can represent numbers between 0 and 65535, inclusive. In add mode, CO is active (High) when the sum exceeds the bounds of the adder/subtracter. In subtract mode, CO is an active-Low borrow-out and goes Low when the difference exceeds the bounds.

An unsigned binary "overflow" that is always active-High can be generated by gating the ADD signal and CO as follows:

```
unsigned overflow = CO XOR ADD
```

OFL is ignored in unsigned binary operation.

Two's-Complement Operation -For two's-complement operation, this element can represent numbers between -32768 and +32767, inclusive.

If an addition or subtraction operation result exceeds this range, the OFL output goes High. CO is ignored in two's-complement operation.

Design Entry Method

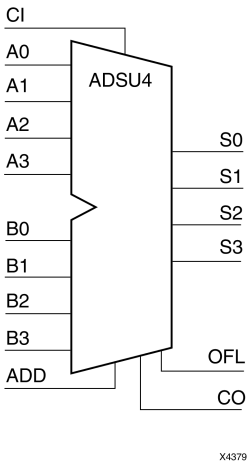
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ADSU4

Macro: 4-Bit Cascadable Adder/Subtracter with Carry-In, Carry-Out, and Overflow



Introduction

When the ADD input is High, this element adds two 4-bit words (A3:A0 and B3:B0) and a carry-in (CI), producing a 4-bit sum output (S3:S0) and a carry-out (CO) or an overflow (OFL).

When the ADD input is Low, this element subtracts B3:B0 from A3:A0, producing a 4-bit difference output (S3:S0) and a carry-out (CO) or an overflow (OFL).

In add mode, CO and CI are active-High. In subtract mode, CO and CI are active-Low. OFL is active-High in add and subtract modes.

Logic Table

Input			Output
ADD	**A**	**B**	**S**
1	An	Bn	An+Bn+CI*
0	An	Bn	An-Bn-CI*
CI*: ADD = 0, CI, CO active LOW CI*: ADD = 1, CI, CO active HIGH			

Unsigned Binary Versus Two's Complement -This design element can operate on either 4-bit unsigned binary numbers or 4-bit two's-complement numbers. If the inputs are interpreted as unsigned binary, the result can be interpreted as unsigned binary. If the inputs are interpreted as two's complement, the output can be interpreted as two's complement. The only functional difference between an unsigned binary operation and a two's-complement operation is the way they determine when "overflow" occurs. Unsigned binary uses CO, while two's complement uses OFL to determine when "overflow" occurs.

With adder/subtracters, either unsigned binary or two's-complement operations cause an overflow. If the result crosses the overflow boundary, an overflow is generated. Similarly, when the result crosses the carry-out boundary, a carry-out is generated.

Unsigned Binary Operation -For unsigned binary operation, ADSU4 can represent numbers between 0 and 15, inclusive. In add mode, CO is active (High) when the sum exceeds the bounds of the adder/subtracter. In subtract mode, CO is an active-Low borrow-out and goes Low when the difference exceeds the bounds.

An unsigned binary "overflow" that is always active-High can be generated by gating the ADD signal and CO as follows:

```
unsigned overflow = CO XOR ADD
```

OFL is ignored in unsigned binary operation.

Two's-Complement Operation -For two's-complement operation, this element can represent numbers between -8 and +7, inclusive.

If an addition or subtraction operation result exceeds this range, the OFL output goes High. CO is ignored in two's-complement operation.

Design Entry Method

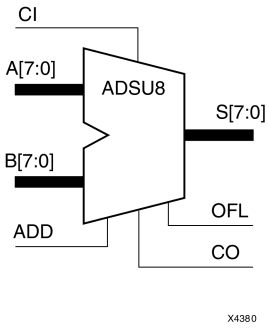
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ADSU8

Macro: 8-Bit Cascadable Adder/Subtracter with Carry-In, Carry-Out, and Overflow



Introduction

When the ADD input is High, this element adds two 8-bit words (A7:A0 and B7:B0) and a carry-in (CI), producing, an 8-bit sum output (S7:S0) and carry-out (CO) or an overflow (OFL).

When the ADD input is Low, this element subtracts B7:B0 from A7:A0, producing an 8-bit difference output (S7:S0) and a carry-out (CO) or an overflow (OFL).

In add mode, CO and CI are active-High. In subtract mode, CO and CI are active-Low. OFL is active-High in add and subtract modes.

Logic Table

Input			Output
ADD	**A**	**B**	**S**
1	An	Bn	An+Bn+CI*
0	An	Bn	An-Bn-CI*
CI*: ADD = 0, CI, CO active LOW CI*: ADD = 1, CI, CO active HIGH			

Unsigned Binary Versus Two's Complement -This design element can operate on either 8-bit unsigned binary numbers or 8-bit two's-complement numbers. If the inputs are interpreted as unsigned binary, the result can be interpreted as unsigned binary. If the inputs are interpreted as two's complement, the output can be interpreted as two's complement. The only functional difference between an unsigned binary operation and a two's-complement operation is the way they determine when "overflow" occurs. Unsigned binary uses CO, while two's complement uses OFL to determine when "overflow" occurs.

With adder/subtracters, either unsigned binary or two's-complement operations cause an overflow. If the result crosses the overflow boundary, an overflow is generated. Similarly, when the result crosses the carry-out boundary, a carry-out is generated.

Unsigned Binary Operation -For unsigned binary operation, this element can represent numbers between 0 and 255, inclusive. In add mode, CO is active (High) when the sum exceeds the bounds of the adder/subtracter. In subtract mode, CO is an active-Low borrow-out and goes Low when the difference exceeds the bounds.

An unsigned binary "overflow" that is always active-High can be generated by gating the ADD signal and CO as follows:

```
unsigned overflow = CO XOR ADD
```

OFL is ignored in unsigned binary operation.

Two's-Complement Operation -For two's-complement operation, this element can represent numbers between -128 and +127, inclusive.

If an addition or subtraction operation result exceeds this range, the OFL output goes High. CO is ignored in two's-complement operation.

Design Entry Method

This design element is only for use in schematics.

For More Information

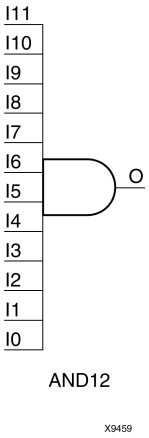
- See the *Spartan-3A FPGA Family Data Sheet*.

AND12

Macro: 12- Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

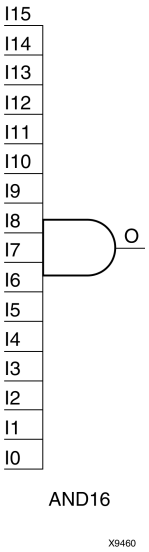
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND16

Macro: 16- Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

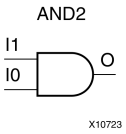
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND2

Primitive: 2-Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

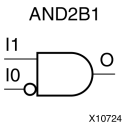
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND2B1

Primitive: 2-Input AND Gate with 1 Inverted and 1 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

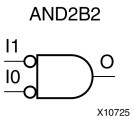
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND2B2

Primitive: 2-Input AND Gate with Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

This design element is only for use in schematics.

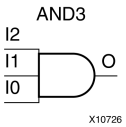
AND3

Primitive: 3-Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

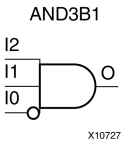
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND3B1

Primitive: 3-Input AND Gate with 1 Inverted and 2 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

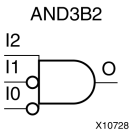
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND3B2

Primitive: 3-Input AND Gate with 2 Inverted and 1 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

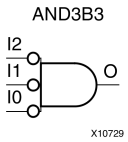
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND3B3

Primitive: 3-Input AND Gate with Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

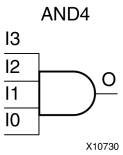
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND4

Primitive: 4-Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

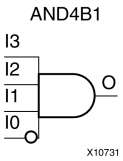
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND4B1

Primitive: 4-Input AND Gate with 1 Inverted and 3 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

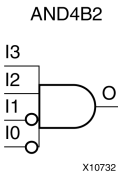
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND4B2

Primitive: 4-Input AND Gate with 2 Inverted and 2 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

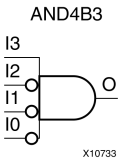
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND4B3

Primitive: 4-Input AND Gate with 3 Inverted and 1 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

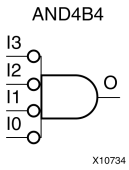
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND4B4

Primitive: 4-Input AND Gate with Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

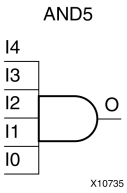
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND5

Primitive: 5-Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

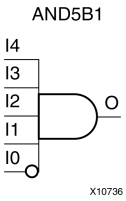
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND5B1

Primitive: 5-Input AND Gate with 1 Inverted and 4 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

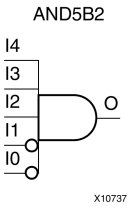
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND5B2

Primitive: 5-Input AND Gate with 2 Inverted and 3 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

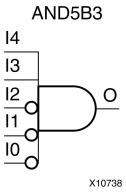
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND5B3

Primitive: 5-Input AND Gate with 3 Inverted and 2 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

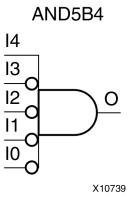
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND5B4

Primitive: 5-Input AND Gate with 4 Inverted and 1 Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

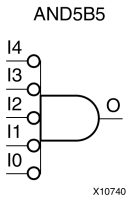
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND5B5

Primitive: 5-Input AND Gate with Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

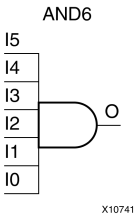
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND6

Macro: 6-Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

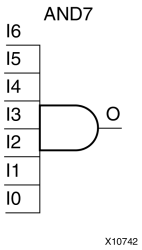
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND7

Macro: 7-Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

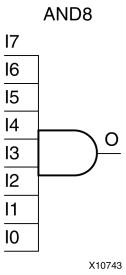
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND8

Macro: 8-Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

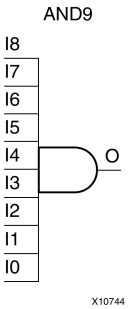
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

AND9

Macro: 9-Input AND Gate with Non-Inverted Inputs



Introduction

AND functions of up to five inputs are available in any combination of inverting and non-inverting inputs. AND functions of six to nine inputs, 12 inputs, and 16 inputs are available with noninverting inputs. To make some or all inputs inverting, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the appropriate number of inputs.

Design Entry Method

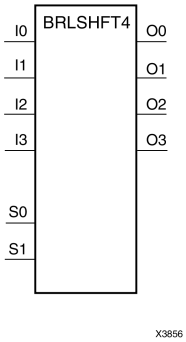
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BRLSHFT4

Macro: 4-Bit Barrel Shifter



Introduction

This design element is a 4-bit barrel shifter that can rotate four inputs (I3 : I0) up to four places. The control inputs (S1 and S0) determine the number of positions, from one to four, that the data is rotated. The four outputs (O3 : O0) reflect the shifted data inputs.

Logic Table

Inputs						Outputs			
S1	**S0**	**I0**	**I1**	**I2**	**I3**	**O0**	**O1**	**O2**	**O3**
0	0	a	b	c	d	a	b	c	d
0	1	a	b	c	d	b	c	d	a
1	0	a	b	c	d	c	d	a	b
1	1	a	b	c	d	d	a	b	c

Design Entry Method

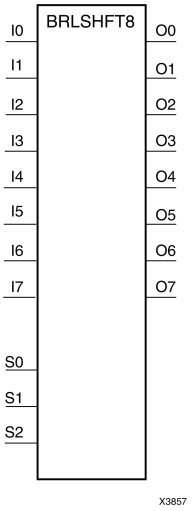
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BRLSHFT8

Macro: 8-Bit Barrel Shifter



Introduction

This design element is an 8-bit barrel shifter, can rotate the eight inputs (I7 : I0) up to eight places. The control inputs (S2 : S0) determine the number of positions, from one to eight, that the data is rotated. The eight outputs (O7 : O0) reflect the shifted data inputs.

Logic Table

Inputs											Outputs							
S2	**S1**	**S0**	**I0**	**I1**	**I2**	**I3**	**I4**	**I5**	**I6**	**I7**	**O0**	**O1**	**O2**	**O3**	**O4**	**O5**	**O6**	**O7**
0	0	0	a	b	c	d	e	f	g	h	a	b	c	d	e	f	g	h
0	0	1	a	b	c	d	e	f	g	h	b	c	d	e	f	g	h	a
0	1	0	a	b	c	d	e	f	g	h	c	d	e	f	g	h	a	b
0	1	1	a	b	c	d	e	f	g	h	d	e	f	g	h	a	b	c
1	0	0	a	b	c	d	e	f	g	h	e	f	g	h	a	b	c	d
1	0	1	a	b	c	d	e	f	g	h	f	g	h	a	b	c	d	e
1	1	0	a	b	c	d	e	f	g	h	g	h	a	b	c	d	e	f
1	1	1	a	b	c	d	e	f	g	h	h	a	b	c	d	e	f	g

Design Entry Method

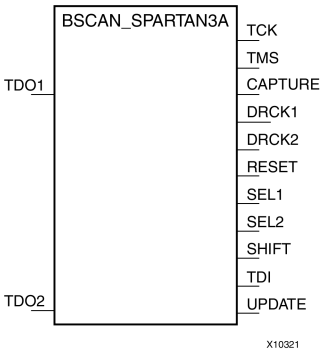
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BSCAN_SPARTAN3A

Primitive: Spartan®-3A JTAG Boundary Scan Logic Access Circuit



Introduction

This design element allows access to and from internal logic by the JTAG Boundary Scan logic controller. This allows for communication between the internal running design and the dedicated JTAG pins of the FPGA.

Note For specific information on boundary scan for an architecture, see the Programmable Logic Data Sheet for this element.

Port Descriptions

Port	Direction	Width	Function
TDI	Output	1	A mirror of the TDI input pin to the FPGA.
DRCK1, DRK2	Output	1	A mirror of the TCK input pin to the FPGA when the JTAG USER instruction is loaded and the JTAG TAP controller is in the SHIFT-DR state. DRK1 applies to the USER1 logic while DRK2 applies to USER2.
RESET	Output	1	Active upon the loading of the USER instruction. It asserts High when the JTAG TAP controller is in the TEST-LOGIC-RESET state.
SEL1, SEL2	Output	1	Indicates when the USER1 or USER2 instruction has been loaded into the JTAG Instruction Register. SEL1 or SEL2 becomes active in the UPDATE-IR state, and stays active until a new instruction is loaded.
SHIFT	Output	1	Active upon the loading of the USER instruction. It asserts High when the JTAG TAP controller is in the SHIFT-DR state.
CAPTURE	Output	1	Active upon the loading of the USER instruction. Asserts High when the JTAG TAP controller is in the CAPTURE-DR state.
UPDATE	Output	1	Active upon the loading of the USER instruction. It asserts High when the JTAG TAP controller is in the UPDATE-DR state.
TCK	Output	1	TCK output from TAP controller
TMS	Output	1	TMS output from TAP controller
TDO1, TDO2	Input	1	Active upon the loading of the USER1 or USER2 instruction. External JTAG TDO pin reflects data input to the component's TDO1 (USER1) or TDO2 (USER2) pin.

Design Entry Method

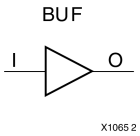
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BUF

Primitive: General Purpose Buffer



Introduction

This is a general-purpose, non-inverting buffer.

This element is not necessary and is removed by the partitioning software (MAP).

Design Entry Method

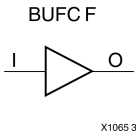
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BUFCF

Primitive: Fast Connect Buffer



Introduction

This design element is a single fast connect buffer used to connect the outputs of the LUTs and some dedicated logic directly to the input of another LUT. Using this buffer implies CLB packing. No more than four LUTs may be connected together as a group.

Design Entry Method

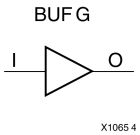
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BUFG

Primitive: Global Clock Buffer



Introduction

This design element is a high-fanout buffer that connects signals to the global routing resources for low skew distribution of the signal. BUFGs are typically used on clock nets as well other high fanout nets like sets/resets and clock enables.

Port Descriptions

Port	Type	Width	Function
I	Input	1	Clock buffer input
O	Output	1	Clock buffer output

Design Entry Method

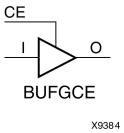
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BUFGCE

Primitive: Global Clock Buffer with Clock Enable



Introduction

This design element is a global clock buffer with a single gated input. Its O output is "0" when clock enable (CE) is Low (inactive). When clock enable (CE) is High, the I input is transferred to the O output.

Logic Table

Inputs		Outputs
I	**CE**	**O**
X	0	0
I	1	I

Port Descriptions

Port	Type	Width	Function
I	Input	1	Clock buffer input
CE	Input	1	Clock enable input
O	Output	1	Clock buffer output

Design Entry Method

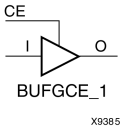
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BUFGCE_1

Primitive: Global Clock Buffer with Clock Enable and Output State 1



Introduction

This design element is a multiplexed global clock buffer with a single gated input. Its O output is High (1) when clock enable (CE) is Low (inactive). When clock enable (CE) is High, the I input is transferred to the O output.

Logic Table

Inputs		Outputs
I	**CE**	**O**
X	0	1
I	1	I

Port Descriptions

Port	Type	Width	Function
I	Input	1	Clock buffer input
CE	Input	1	Clock enable input
O	Output	1	Clock buffer output

Design Entry Method

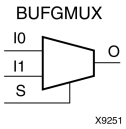
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BUFGMUX

Primitive: Global Clock MUX Buffer



Introduction

BUFGMUX is a multiplexed global clock buffer that can select between two input clocks: I0 and I1. When the select input (S) is Low, the signal on I0 is selected for output (O). When the select input (S) is High, the signal on I1 is selected for output.

BUFGMUX and BUFGMUX_1 are distinguished by the state the output assumes when that output switches between clocks in response to a change in its select input. BUGFMUX assumes output state 0 and BUFGMUX_1 assumes output state 1.

Note BUFGMUX guarantees that when S is toggled, the state of the output remains in the inactive state until the next active clock edge (either I0 or I1) occurs.

Logic Table

Inputs			Outputs
I0	**I1**	**S**	**O**
I0	X	0	I0
X	I1	1	I1
X	X	↑	0
X	X	↓	0

Port Descriptions

Port	Type	Width	Function
I0	Input	1	Clock0 input
I1	Input	1	Clock1 input
O	Output	1	Clock MUX output
S	Input	1	Clock select input

Design Entry Method

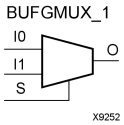
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

BUFGMUX_1

Primitive: Global Clock MUX Buffer with Output State 1



Introduction

This design element is a multiplexed global clock buffer that can select between two input clocks: I0 and I1. When the select input (S) is Low, the signal on I0 is selected for output (0). When the select input (S) is High, the signal on I1 is selected for output.

This design element is distinguished from BUFGMUX by the state the output assumes when that output switches between clocks in response to a change in its select input. BUFGMUX assumes output state 0 and BUFGMUX_1 assumes output state 1.

Logic Table

Inputs			Outputs
I0	**I1**	**S**	**O**
I0	X	0	I0
X	I1	1	I1
X	X	↑	1
X	X	↓	1

Port Descriptions

Port	Type	Width	Function
I0	Input	1	Clock0 input
I1	Input	1	Clock1 input
O	Output	1	Clock MUX output
S	Input	1	Clock select input

Design Entry Method

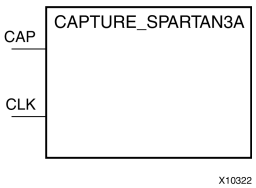
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

CAPTURE_SPARTAN3A

Primitive: Spartan®-3A Register State Capture for Bitstream Readback



Introduction

This element provides user control and synchronization over when and how the capture register (flip-flop and latch) information task is requested. The readback function is provided through dedicated configuration port instructions. However, without this element, the readback data is synchronized to the configuration clock. Only register (flip-flop and latch) states can be captured. Although LUT RAM, SRL, and block RAM states are readback, they cannot be captured.

An asserted high CAP signal indicates that the registers in the device are to be captured at the next Low-to-High clock transition. By default, data is captured after every trigger when transition on CLK while CAP is asserted. To limit the readback operation to a single data capture, add the ONESHOT=TRUE attribute to this element.

Port Descriptions

Port	Direction	Width	Function
CAP	Input	1	Readback capture trigger
CLK	Input	1	Readback capture clock

Design Entry Method

This design element can be used in schematics.

Connect all inputs and outputs to the design in order to ensure proper operation.

Available Attributes

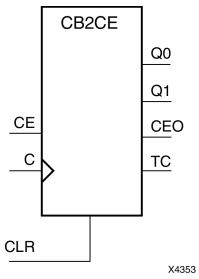
Attribute	Type	Allowed Values	Default	Description
ONESHOT	Boolean	TRUE, FALSE	TRUE	Specifies the procedure for performing single readback per CAP trigger.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

CB2CE

Macro: 2-Bit Cascadable Binary Counter with Clock Enable and Asynchronous Clear



Introduction

This design element is an asynchronously clearable, cascadable binary counter. The asynchronous clear (CLR) input, when High, overrides all other inputs and forces the Q outputs, terminal count (TC), and clock enable out (CEO) to logic level zero, independent of clock transitions. The Q outputs increment when the clock enable input (CE) is High during the Low-to-High clock (C) transition. The counter ignores clock transitions when CE is Low. The TC output is High when all Q outputs are High.

Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C and CLR inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs		
CLR	**CE**	**C**	**Qz-Q0**	**TC**	**CEO**
1	X	X	0	0	0
0	0	X	No change	No change	0
0	1	↑	Inc	TC	CEO
z = bit width - 1 TC = Qz•Q(z-1)•Q(z-2)•...•Q0 CEO = TC•CE					

Design Entry Method

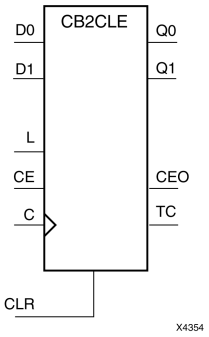
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

CB2CLE

Macro: 2-Bit Loadable Cascadable Binary Counters with Clock Enable and Asynchronous Clear



Introduction

This element is a synchronously loadable, asynchronously clearable, cascadable binary counter. The asynchronous clear (CLR) input, when High, overrides all other inputs and forces the Q outputs, terminal count (TC), and clock enable out (CEO) to logic level zero, independent of clock transitions. The data on the D inputs is loaded into the counter when the load enable input (L) is High during the Low-to-High clock transition, independent of the state of clock enable (CE). The Q outputs increment when CE is High during the Low-to-High clock transition. The counter ignores clock transitions when CE is Low. The TC output is High when all Q outputs are High.

Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C, L, and CLR inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs					**Outputs**		
CLR	**L**	**CE**	**C**	**Dz-D0**	**Qz-Q0**	**TC**	**CEO**
1	X	X	X	X	0	0	0
0	1	X	↑	Dn	Dn	TC	CEO
0	0	0	X	X	No change	No change	0
0	0	1	↑	X	Inc	TC	CEO
z = bit width - 1 TC = Qz•Q(z-1)•Q(z-2)•...•Q0 CEO = TC•CE							

Design Entry Method

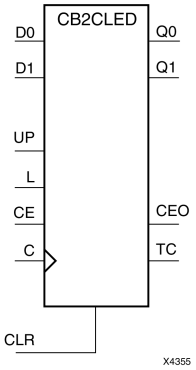
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

CB2CLED

Macro: 2-Bit Loadable Cascadable Bidirectional Binary Counters with Clock Enable and Asynchronous Clear



Introduction

This design element is a synchronously loadable, asynchronously clearable, cascadable, bidirectional binary counter. The asynchronous clear (CLR) input, when High, overrides all other inputs and forces the Q outputs, terminal count (TC), and clock enable out (CEO) to logic level zero, independent of clock transitions. The data on the D inputs is loaded into the counter when the load enable input (L) is High during the Low-to-High clock (C) transition, independent of the state of clock enable (CE). The Q outputs decrement when CE is High and UP is Low during the Low-to- High clock transition. The Q outputs increment when CE and UP are High. The counter ignores clock transitions when CE is Low.

For counting up, the TC output is High when all Q outputs and UP are High. For counting down, the TC output is High when all Q outputs and UP are Low.

Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C, UP, L, and CLR inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

For CPLD parts, see “CB2X1”, “CB4X1”, “CB8X1”, “CB16X1” for high-performance cascadable, bidirectional counters.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs						Outputs		
CLR	**L**	**CE**	**C**	**UP**	**Dz-D0**	**Qz-Q0**	**TC**	**CEO**
1	X	X	X	X	X	0	0	0
0	1	X	↑	X	Dn	Dn	TC	CEO
0	0	0	X	X	X	No change	No change	0
0	0	1	↑	1	X	Inc	TC	CEO

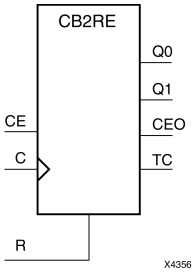
CB2RE

Macro: 2-Bit Cascadable Binary Counter with Clock Enable and Synchronous Reset



Introduction

This design element is a synchronous, resettable, cascadable binary counter. The synchronous reset (R), when High, overrides all other inputs and forces the Q outputs, terminal count (TC), and clock enable out (CEO) to zero on the Low-to-High clock transition. The Q outputs increment when the clock enable input (CE) is High during the Low-to-High clock (C) transition. The counter ignores clock transitions when CE is Low. The TC output is High when both Q outputs are High.

Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C and R inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs		
R	**CE**	**C**	**Qz-Q0**	**TC**	**CEO**
1	X	↑	0	0	0
0	0	X	No change	No change	0
0	1	↑	Inc	TC	CEO

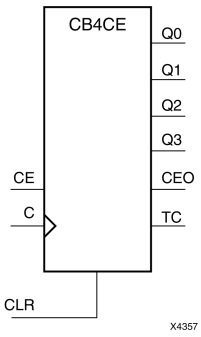
CB4CE

Macro: 4-Bit Cascadable Binary Counter with Clock Enable and Asynchronous Clear



Introduction

This design element is an asynchronously clearable, cascadable binary counter. The asynchronous clear (CLR) input, when High, overrides all other inputs and forces the Q outputs, terminal count (TC), and clock enable out (CEO) to logic level zero, independent of clock transitions. The Q outputs increment when the clock enable input (CE) is High during the Low-to-High clock (C) transition. The counter ignores clock transitions when CE is Low. The TC output is High when all Q outputs are High.

Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C and CLR inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

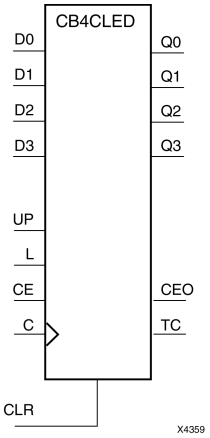
CB4CLED

Macro: 4-Bit Loadable Cascadable Bidirectional Binary Counters with Clock Enable and Asynchronous Clear



Introduction

This design element is a synchronously loadable, asynchronously clearable, cascadable, bidirectional binary counter. The asynchronous clear (CLR) input, when High, overrides all other inputs and forces the Q outputs, terminal count (TC), and clock enable out (CEO) to logic level zero, independent of clock transitions. The data on the D inputs is loaded into the counter when the load enable input (L) is High during the Low-to-High clock (C) transition, independent of the state of clock enable (CE). The Q outputs decrement when CE is High and UP is Low during the Low-to- High clock transition. The Q outputs increment when CE and UP are High. The counter ignores clock transitions when CE is Low.

For counting up, the TC output is High when all Q outputs and UP are High. For counting down, the TC output is High when all Q outputs and UP are Low.

Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C, UP, L, and CLR inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

For CPLD parts, see “CB2X1”, “CB4X1”, “CB8X1”, “CB16X1” for high-performance cascadable, bidirectional counters.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

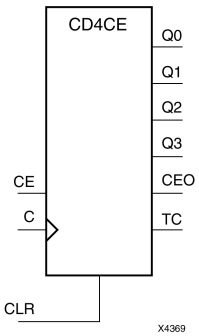
CD4CE

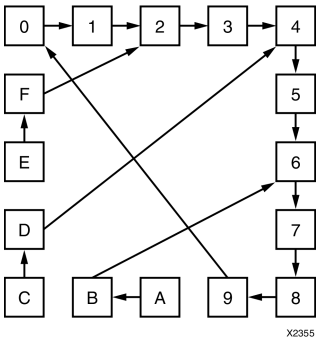
Macro: 4-Bit Cascadable BCD Counter with Clock Enable and Asynchronous Clear



Introduction

CD4CE is a 4-bit (stage), asynchronous clearable, cascadable binary-coded-decimal (BCD) counter. The asynchronous clear input (CLR) is the highest priority input. When CLR is High, all other inputs are ignored; the Q outputs, terminal count (TC), and clock enable out (CEO) go to logic level zero, independent of clock transitions. The Q outputs increment when clock enable (CE) is High during the Low-to-High clock (C) transition. The counter ignores clock transitions when CE is Low. The TC output is High when Q3 and Q0 are High and Q2 and Q1 are Low.

The counter recovers from any of six possible illegal states and returns to a normal count sequence within two clock cycles for Xilinx® devices, as shown in the following state diagram:



Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C and CLR inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs					
CLR	**CE**	**C**	**Q3**	**Q2**	**Q1**	**Q0**	**TC**	**CEO**
1	X	X	0	0	0	0	0	0
0	1	↑	Inc	Inc	Inc	Inc	TC	CEO
0	0	X	No Change	No Change	No Change	No Change	TC	0
0	1	X	1	0	0	1	1	1

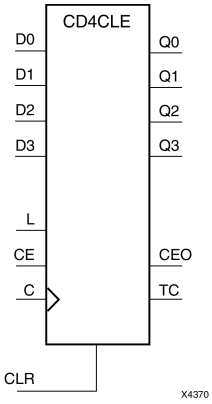
CD4CLE

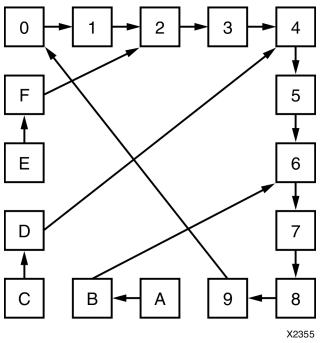
Macro: 4-Bit Loadable Cascadable BCD Counter with Clock Enable and Asynchronous Clear



Introduction

CD4CLE is a 4-bit (stage), synchronously loadable, asynchronously clearable, binarycoded- decimal (BCD) counter. The asynchronous clear input (CLR) is the highest priority input. When (CLR) is High, all other inputs are ignored; the (Q) outputs, terminal count (TC), and clock enable out (CEO) go to logic level zero, independent of clock transitions. The data on the (D) inputs is loaded into the counter when the load enable input (L) is High during the Low-to-High clock (C) transition. The (Q) outputs increment when clock enable input (CE) is High during the Low- to-High clock transition. The counter ignores clock transitions when (CE) is Low. The (TC) output is High when Q3 and Q0 are High and Q2 and Q1 are Low.

The counter recovers from any of six possible illegal states and returns to a normal count sequence within two clock cycles for Xilinx® devices, as shown in the following state diagram:



Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C, L, and CLR inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs					Outputs					
CLR	**L**	**CE**	**D3 : D0**	**C**	**Q3**	**Q2**	**Q1**	**Q0**	**TC**	**CEO**
1	X	X	X	X	0	0	0	0	0	0
0	1	X	D3 : D0	↑	D3	D2	D1	D0	TC	CEO
0	0	1	X	↑	Inc	Inc	Inc	Inc	TC	CEO

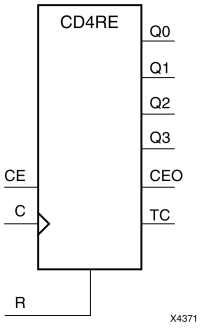
CD4RE

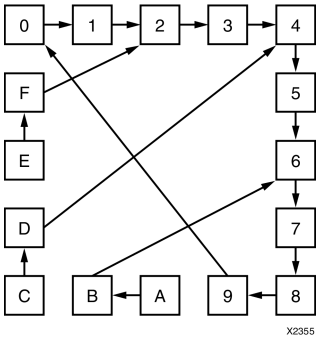
Macro: 4-Bit Cascadable BCD Counter with Clock Enable and Synchronous Reset



Introduction

CD4RE is a 4-bit (stage), synchronous resettable, cascadable binary-coded-decimal (BCD) counter. The synchronous reset input (R) is the highest priority input. When (R) is High, all other inputs are ignored; the (Q) outputs, terminal count (TC), and clock enable out (CEO) go to logic level zero on the Low-to-High clock (C) transition. The (Q) outputs increment when the clock enable input (CE) is High during the Low-to- High clock transition. The counter ignores clock transitions when (CE) is Low. The (TC) output is High when Q3 and Q0 are High and Q2 and Q1 are Low.

The counter recovers from any of six possible illegal states and returns to a normal count sequence within two clock cycles for Xilinx® devices, as shown in the following state diagram:



Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C and R inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

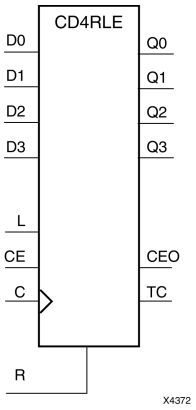
CD4RLE

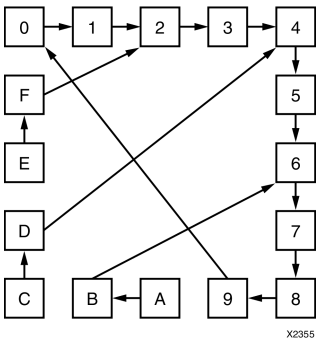
Macro: 4-Bit Loadable Cascadable BCD Counter with Clock Enable and Synchronous Reset



Introduction

CD4RLE is a 4-bit (stage), synchronous loadable, resettable, binary-coded-decimal (BCD) counter. The synchronous reset input (R) is the highest priority input. When R is High, all other inputs are ignored; the Q outputs, terminal count (TC), and clock enable out (CEO) go to logic level zero on the Low-to-High clock transitions. The data on the D inputs is loaded into the counter when the load enable input (L) is High during the Low-to-High clock (C) transition. The Q outputs increment when the clock enable input (CE) is High during the Low-to-High clock transition. The counter ignores clock transitions when CE is Low. The TC output is High when Q3 and Q0 are High and Q2 and Q1 are Low.

The counter recovers from any of six possible illegal states and returns to a normal count sequence within two clock cycles for Xilinx® devices, as shown in the following state diagram:



Create larger counters by connecting the CEO output of each stage to the CE input of the next stage and connecting the C, L, and R inputs in parallel. CEO is active (High) when TC and CE are High. The maximum length of the counter is determined by the accumulated CE-to-TC propagation delays versus the clock period. The clock period must be greater than n ($t_{CE\text{-}TC}$), where n is the number of stages and the time $t_{CE\text{-}TC}$ is the CE-to-TC propagation delay of each stage. When cascading counters, use the CEO output if the counter uses the CE input or use the TC output if it does not.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

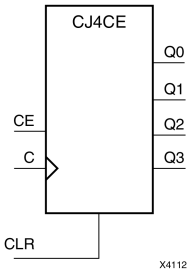
CJ4CE

4-Bit Johnson Counter with Clock Enable and Asynchronous Clear



Introduction

This design element is a clearable Johnson/shift counter. The asynchronous clear (CLR) input, when High, overrides all other inputs and forces the data (Q) outputs to logic level zero, independent of clock (C) transitions. The counter increments (shifts Q0 to Q1, Q1 to Q2,and so forth) when the clock enable input (CE) is High during the Low-to-High clock transition. Clock transitions are ignored when (CE) is Low.

The Q3 output is inverted and fed back to input Q0 to provide continuous counting operation.

This counter is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			**Outputs**	
CLR	**CE**	**C**	**Q0**	**Q1 through Q3**
1	X	X	0	0
0	0	X	No change	No change
0	1	↑	!q3	q0 through q2
q = state of referenced output one setup time prior to active clock transition				

Design Entry Method

This design element is only for use in schematics.

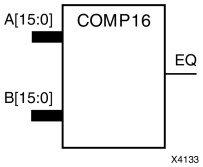
COMP16

Macro: 16-Bit Identity Comparator



Introduction

This design element is a 16-bit identity comparator. The equal output (EQ) is high when A15 : A0 and B15 : B0 are equal.

Equality is determined by a bit comparison of the two words. When any two of the corresponding bits from each word are not the same, the EQ output is Low.

Design Entry Method

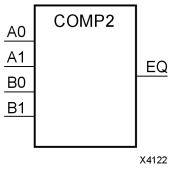
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

COMP2

Macro: 2-Bit Identity Comparator



Introduction

This design element is a 2-bit identity comparator. The equal output (EQ) is High when the two words A1 : A0 and B1 : B0 are equal.

Equality is determined by a bit comparison of the two words. When any two of the corresponding bits from each word are not the same, the EQ output is Low.

Design Entry Method

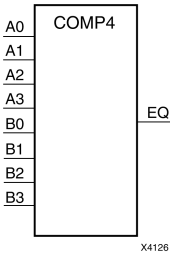
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

COMP4

Macro: 4-Bit Identity Comparator



Introduction

This design element is a 4-bit identity comparator. The equal output (EQ) is high when A3 : A0 and B3 : B0 are equal.

Equality is determined by a bit comparison of the two words. When any two of the corresponding bits from each word are not the same, the EQ output is Low.

Design Entry Method

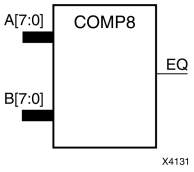
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

COMP8

Macro: 8-Bit Identity Comparator



Introduction

This design element is an 8-bit identity comparator. The equal output (EQ) is high when A7 : A0 and B7 : B0 are equal.

Equality is determined by a bit comparison of the two words. When any two of the corresponding bits from each word are not the same, the EQ output is Low.

Design Entry Method

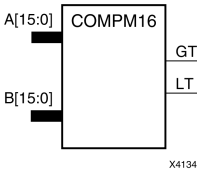
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

COMPM16

Macro: 16-Bit Magnitude Comparator



Introduction

This design element is a 16-bit magnitude comparator that compare two positive Binary-weighted words. It compares A15 : A0 and B15 : B0, where A15 and B15 are the most significant bits.

The greater-than output (GT) is High when A > B, and the less-than output (LT) is High when A < B When the two words are equal, both GT and LT are Low. Equality can be measured with this macro by comparing both outputs with a NOR gate.

Logic Table

Inputs								Outputs	
A7, B7	**A6, B6**	**A5, B5**	**A4, B4**	**A3, B3**	**A2, B2**	**A1, B1**	**A0, B0**	**GT**	**LT**

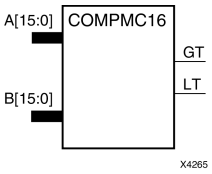
COMPMC16

Macro: 16-Bit Magnitude Comparator



Introduction

This design element is a 16-bit, magnitude comparator that compares two positive Binary weighted words A15 : A0 and B15 : B0, where A15 and B15 are the most significant bits.

This comparator is implemented using carry logic with relative location constraints to ensure efficient logic placement.

The greater-than output (GT) is High when A>B, and the less-than output (LT) is High when A<B. When the two words are equal, both GT and LT are Low. Equality can be flagged with this macro by connecting both outputs to a NOR gate.

Logic Table

Inputs								Outputs	
A7, B7	A6, B6	A5, B5	A4, B4	A3, B3	A2, B2	A1, B1	A0, B0	GT	LT
A7>B7	X	X	X	X	X	X	X	1	0
A7<B7	X	X	X	X	X	X	X	0	1
A7=B7	A6>B6	X	X	X	X	X	X	1	0

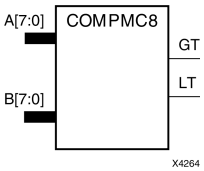
COMPMC8

Macro: 8-Bit Magnitude Comparator



Introduction

This design element is an 8-bit, magnitude comparator that compares two positive Binaryweighted words A7 : A0 and B7 : B0, where A7 and B7 are the most significant bits.

This comparator is implemented using carry logic with relative location constraints to ensure efficient logic placement.

The greater-than output (GT) is High when A>B, and the less-than output (LT) is High when A<B. When the two words are equal, both GT and LT are Low. Equality can be flagged with this macro by connecting both outputs to a NOR gate.

Logic Table

Inputs								Outputs	
A7, B7	**A6, B6**	**A5, B5**	**A4, B4**	**A3, B3**	**A2, B2**	**A1, B1**	**A0, B0**	**GT**	**LT**
A7>B7	X	X	X	X	X	X	X	1	0
A7<B7	X	X	X	X	X	X	X	0	1

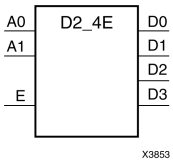
D2_4E

Macro: 2- to 4-Line Decoder/Demultiplexer with Enable



Introduction

This design element is a decoder/demultiplexer. When the enable (E) input of this element is High, one of four active-High outputs (D3 : D0) is selected with a 2-bit binary address (A1 : A0) input. The non-selected outputs are Low. Also, when the E input is Low, all outputs are Low. In demultiplexer applications, the E input is the data input.

Logic Table

Inputs			Outputs			
A1	**A0**	**E**	**D3**	**D2**	**D1**	**D0**
X	X	0	0	0	0	0
0	0	1	0	0	0	1
0	1	1	0	0	1	0
1	0	1	0	1	0	0
1	1	1	1	0	0	0

Design Entry Method

This design element is only for use in schematics.

For More Information

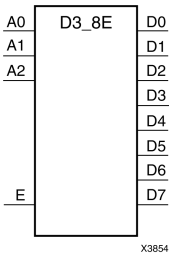
D3_8E

Macro: 3- to 8-Line Decoder/Demultiplexer with Enable



Introduction

When the enable (E) input of the D3_8E decoder/demultiplexer is High, one of eight active-High outputs (D7 : D0) is selected with a 3-bit binary address (A2 : A0) input. The non-selected outputs are Low. Also, when the E input is Low, all outputs are Low. In demultiplexer applications, the E input is the data input.

Logic Table

Inputs				Outputs							
A2	**A1**	**A0**	**E**	**D7**	**D6**	**D5**	**D4**	**D3**	**D2**	**D1**	**D0**
X	X	X	0	0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0	0	0	0	1
0	0	1	1	0	0	0	0	0	0	1	0
0	1	0	1	0	0	0	0	0	1	0	0
0	1	1	1	0	0	0	0	1	0	0	0
1	0	0	1	0	0	0	1	0	0	0	0
1	0	1	1	0	0	1	0	0	0	0	0
1	1	0	1	0	1	0	0	0	0	0	0
1	1	1	1	1	0	0	0	0	0	0	0

- See the *Spartan-3A FPGA Family Data Sheet*.

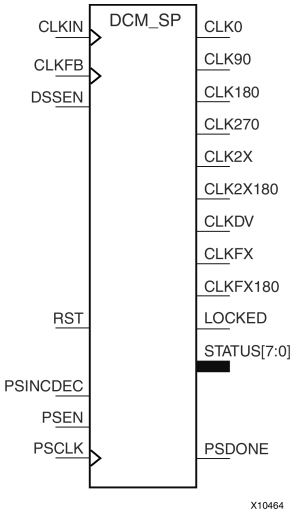
DCM_SP

Primitive: Digital Clock Manager



Introduction

This design element is a digital clock manager that provides multiple functions. It can implement a clock delay locked loop (DLL), a digital frequency synthesizer (DFS), and a digital phase shifter (DPS). DCM_SPs are useful for eliminating the clock delay coming on and off the chip, shifting the clock phase to improve data capture, deriving different frequency clocks, as well as other useful clocking functions.

Port Descriptions

Port	Type	Width	Function
CLKDV	Output	1	Divided clock output, controlled by the CLKDV_DIVIDE attribute. The CLKDV output has a 50% duty cycle unless the CLKDV_DIVIDE attribute is a non-integer value.
CLKFB	Input	1	Clock feedback input to DCM. The feedback input is required unless the DFS outputs, CLKFX or CLKFX180, are used standalone. The source of the CLKFB input must be the CLK0 or CLK2X output from the DCM and the CLK_FEEDBACK must be set to 1X or 2X accordingly. When set to NONE, CLKFB is unused and should be tied low. Ideally, the feedback point includes the delay added by the clock distribution network, either internally or externally.
CLKFX	Output	1	Synthesized clock output, controlled by the CLKFX_MULTIPLY and CLKFX_DIVIDE attributes. Always has a 50% duty cycle. If no phase relationship is necessary, then no clock feedback is required.
CLKFX180	Output	1	Synthesized clock output CLKFX, 180 phase shift (appears to be an inverted version of CLKFX). Always has a 50% duty cycle.If no phase relationship is necessary, then no feedback loop is required.
CLKIN	Input	1	Clock input to DCM. Always required. The CLKIN frequency and jitter must fall within the limits specified in the data sheet.
CLK0	Output	1	Same frequency as CLKIN, 0 phase shift (i.e., not phase shifted).
CLK2X	Output	1	Double-frequency clock output, 0 phase shift. When available, the CLK2X output always has a 50% duty cycle. Either CLK0 or CLK2X is required as a feedback source for DLL functions.

Port	Type	Width	Function
CLK2X180	Output	1	Double-frequency clock output, 180 phase shift. When available, the CLK2X180 output always has a 50% duty cycle.
CLK90	Output	1	Same frequency as CLKIN, 90 phase shift (quarter period).
CLK180	Output	1	Same frequency as CLKIN, 180 phase shift (half period).
CLK270	Output	1	Same frequency as CLKIN, 270 phase shift (three-quarters period).
LOCKED	Output	1	All DCM features have locked onto the CLKIN frequency. Clock outputs are now valid, assuming CLKIN is within specified limits. • 0 - DCM is attempting to lock onto CLKIN frequency. DCM clock outputs are not valid. • 1 - DCM is locked onto CLKIN frequency. DCM clock outputs are valid. • 1-to-0 - DCM lost lock. Reset DCM.
PSCLK	Input	1	Clock input to variable phase shifter, clocked on rising edge. When using a global clock buffer, only the upper eight BUFGMUXs can drive PSCLK: BUFGMUX_X2Y1, BUFGMUX_X2Y2, BUFGMUX_X2Y3, BUFGMUX_X2Y4, BUFGMUX_X3Y5, BUFGMUX_X3Y6, BUFGMUX_X3Y7 and BUFGMUX_X3Y8.
PSDONE	Output	1	Variable phase shift operation complete. • 0 - No phase shift operation is active or phase shift operation is in progress. • 1 - Requested phase shift operation is complete. Output High for one PSCLK cycle. Next variable phase shift operation can commence.
PSEN	Input	1	Variable phase-shift enable. Can be inverted within a DCM block. Non-inverted behavior shown below. • 0 - Disable variable phase shift. Ignore inputs to phase shifter. • 1 - Enable variable phase shift operations on next rising PSCLK clock edge. **Note** Tie to 0 when not in use.
PSINCDEC	Input	1	Increment/decrement variable phase shift. Can be inverted within a DCM block. Non-inverted behavior shown below. • 0 - Decrement phase shift value on next enabled, rising PSCLK clock edge. • 1 - Increment phase shift value on next enabled, rising PSCLK clock edge.
RST	Input	1	Asynchronous reset input. Resets the DCM logic to its postconfiguration state. Causes DCM to reacquire and relock to the CLKIN input. Invertible within DCM block. Non-inverted behavior shown below. • 0 - No effect. • 1 - Reset DCM block. Hold RST pulse High for at least three valid CLKIN cycles.

Port	Type	Width	Function
STATUS[7:0]	Output	8	The status output bus provides DCM status. • STATUS[0] - Variable phase shift overflow. Control output for variable fine phase shifting. The variable phase shifter has reached a minimum or maximum limit value. The limit value is either +/-255 or a lesser value if the phase shift has reached the end of the delay line. – 0 - The phase shift has not yet reached its limit value. – 1 - The phase shift has reached its limited value. • STATUS[1] - CLKIN Input Stopped Indicator. Available only when the CLKFB feedback input is connected. Held in reset until the LOCKED output is asserted. Requires at least one CLKIN cycle to become active. Never asserted if CLKIN never toggles. – 0 - CLKIN input is toggling. – 1 - CLKIN input is not toggling even though the locked output can still be High. • STATUS[2] - CLKFX or CLKFX180 output stopped indicator. – 0 - CLKFX and CLKFX180 outputs are toggling. – 1 - CLKFX and CLKFX180 outputs are not toggling, even though the LOCKED output can still be High. • STATUS[7:3] - Reserved.

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed_Values	Default	Description
CLK_FEEDBACK	String	“1X”, “2X”, “NONE”	“1X”	Defines the DCM feedbcak mode. • 1X: CLK0 as feedback. • 2X: CLK2X as feedback.
CLKDV_DIVIDE	1 significant digit Float	2.0, 1.5, 2.5, 3.0, 3.5, 4.0, 4.5, 5.0, 5.5, 6.0, 6.5, 7.0, 7.5, 8.0, 9.0, 10.0, 11.0, 12.0, 13.0, 14.0, 15.0, 16.0	2.0	Specifies the extent to which the CLKDLL, CLKDLLE, CLKDLLHF, or DCM_SP clock divider (CLKDV output) is to be frequency divided.
CLKFX_DIVIDE	Integer	1 to 32	1	Specifies the frequency divider value for the CLKFX output.
CLKFX_MULTIPLY	Integer	2 to 32	4	Specifies the frequency multiplier value for the CLKFX output.
CLKIN_DIVIDE_BY_2	Boolean	FALSE, TRUE	FALSE	Enables CLKIN divide by two features.
CLKIN_PERIOD	String	0 bit String	“10.0”	Specifies the input period to the DCM_SP CLKIN input in ns.

Attribute	Type	Allowed_Values	Default	Description
CLKOUT_PHASE_SHIFT	String	"NONE", "FIXED", "VARIABLE"	"NONE"	This attribute specifies the phase shift mode. • NONE: No phase shift capability. Any set value has no effect. • FIXED: DCM outputs are a fixed phase shift from CLKIN. Value is specified by PHASE_SHIFT attribute. • VARIABLE: Allows the DCM outputs to be shifted in a positive and negative range relative to CLKIN. Starting value is specified by PHASE_SHIFT.
DESKEW_ADJUST	String	"SYSTEM_SYNCHRONOUS", "SOURCE_SYNCHRONOUS"	"SYSTEM_SYNCHRONOUS"	Sets configuration bits affecting the clock delay alignment between the DCM_SP output clocks and an FPGA clock input pin.
DFS_FREQUENCY_MODE	String	"LOW", "HIGH"	"LOW"	This is a legacy attribute. The DCM is always in the automatic frequency search mode. Setting High or Low makes no effect.
DLL_FREQUENCY_MODE	String	"LOW", "HIGH"	"LOW"	This is a legacy attribute. The DCM is always in the automatic frequency search mode. Setting High or Low makes no effect.
DSS_MODE	String	"NONE", "SPREAD_2", "SPREAD_4", "SPREAD_6", "SPREAD_8"	"NONE"	Specifies a frequency spread for output clocks. • NONE - The default, specifies no spread factors. The digital spread spectrum function is disabled. • SPREAD_2 - Creates a new clock period that is +/- 50 ps of the current clock period • SPREAD_4 - Creates a new clock period that is +/- 100 ps of the current clock period. • SPREAD_6 - Creates a new clock period that is +/- 150 ps of the current clock period. • SPREAD_8 - Creates a new clock period that is +/- 200 ps of the current clock period. The spreading is cumulative as the SPREAD_# is increased. For example, SPREAD_2 creates two additional clock frequencies at +/-50 ps relative to the input clock frequency; SPREAD_4 does the same as SPREAD_2, plus it creates two additional clock frequencies at +/-100 ps.
DUTY_CYCLE_CORRECTION	Boolean	TRUE, FALSE	TRUE	Unsupported
FACTORY_JF	Hexadecimal	16'h8080 to 16'hffff	16'hc080	Unsupported

Attribute	Type	Allowed_Values	Default	Description
PHASE_SHIFT	Integer	-255 to 255	0	The PHASE_SHIFT attribute is applicable only if the CLKOUT_PHASE_SHIFT attribute is set to FIXED or VARIABLE. Defines the rising-edge skew between CLKIN and all the DCM clock outputs at configuration and consequently phase shifts the DCM clock outputs. The skew or phase shift value is specified as an integer that represents a fraction of the clock period as expressed in the equations in Fine Phase Shifting. Actual allowable values depends on input clock frequency. The actual range is less when TCLKIN > FINE_SHIFT_RANGE. The FINE_SHIFT_RANGE specification represents the total delay of all taps in the delay line.
STARTUP_WAIT	Boolean	FALSE, TRUE	FALSE	Controls whether the FPGA configuration signal DONE waits for the DCM to assert its LOCKED signal before going High. • FALSE - Default. DONE is asserted at the end of configuration without waiting for the DCM to assert LOCKED. • TRUE - The DONE signal does not transition High until the LOCKED signal transitions High on the associated DCM. STARTUP_WAIT does not prevent LOCKED from transitioning High. The FPGA startup sequence must also be modified to insert a LCK (lock) cycle before the postponed cycle. The DONE cycle or the GWE cycle are typical choices. When more than one DCM is configured, the FPGA waits until all DCMs are LOCKED.

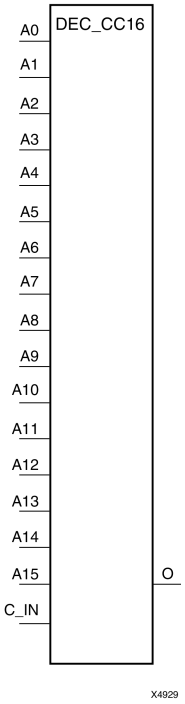
DEC_CC16

Macro: 16-Bit Active Low Decoder



Introduction

This design element is a 16-bit decoder that is used to build wide-decoder functions. It is implemented by cascading CY_MUX elements driven by look-up tables (LUTs). The C_IN pin can only be driven by the output (O) of a previous decode stage. When one or more of the inputs (A) are Low, the output is Low. When all the inputs are High and the C_IN input is High, the output is High. You can decode patterns by adding inverters to inputs.

Logic Table

Inputs					Outputs
A0	**A1**	**...**	**Az**	**C_IN**	**O**
1	1	1	1	1	1
X	X	X	X	0	0
0	X	X	X	X	0
X	0	X	X	X	0
X	X	X	0	X	0

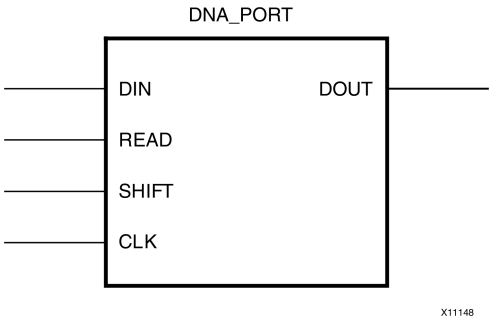
DNA_PORT

Primitive: Device DNA Data Access Port



Introduction

This element allows access to a dedicated shift register that can be loaded with the Device DNA data bits (unique ID) for a given device. In addition to shifting out the DNA data bits, this component allows for the inclusion of supplemental bits of your data, or allows for the DNA data to rollover (repeat DNA data after initial data has been shifted out). This component is primarily used in conjunction with other circuitry to build added copy protection for the FPGA bitstream from possible theft. Connect all inputs and outputs to the design to ensure proper operation. To access the Device DNA data, you must first load the shift register by setting the active high READ signal for one clock cycle. After the shift register is loaded, the data can be synchronously shifted out by enabling the active high SHIFT input and capturing the data out the DOUT output port. Additional data can be appended to the end of the 57-bit shift register by connecting the appropriate logic to the DIN port. If DNA data rollover is desired, connect the DOUT port directly to the DIN port to allow for the same data to be shifted out after completing the 57-bit shift operation. If no additional data is necessary, the DIN port can be tied to a logic zero. The attribute SIM_DNA_VALUE can be optionally set to allow for simulation of a possible DNA data sequence. By default, the Device DNA data bits are all zeros in the simulation model.

Port Descriptions

Port	Type	Width	Function
CLK	Input	1	Clock input.
DIN	Input	1	User data input pin.
DOUT	Output	1	DNA output data.
READ	Input	1	Active high load DNA, active low read input.
SHIFT	Input	1	Active high shift enable input.

Design Entry Method

This design element can be used in schematics.

Connect all inputs and outputs to the design to ensure proper operation.

Available Attributes

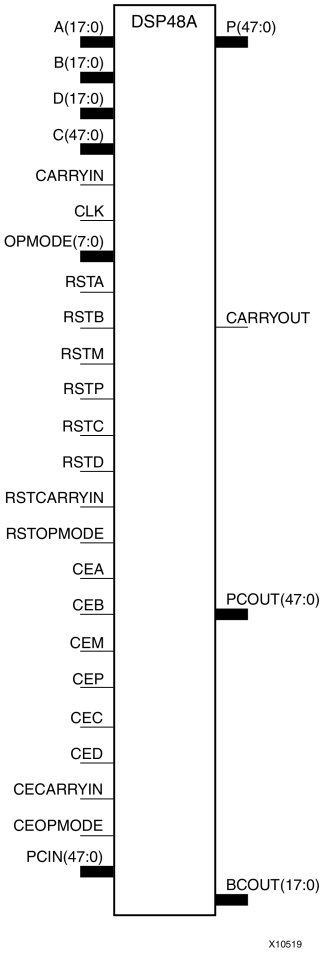
Attribute	Type	Allowed Values	Default	Description
SIM_DNA_VALUE	Hexa-decimal	57'h00000000 0000000 to 57'h1fffffffffffff	57'h00000000 0000000	Specifies the Pre-programmed factory ID value.

For More Information

See the *Spartan-3A FPGA Family Data Sheet*.

DSP48A

Primitive: Multi-Functional, Cascadable, 48-bit Output, Arithmetic Block



Introduction

The DSP48A is a versatile, scalable, hard IP block that allows for the creation of compact, high-speed, arithmetic-intensive operations, such as those seen for many DSP algorithms. The block consists of a configurable, 18-bit, pre-add/sub, followed by an 18x18 signed multiplier, followed by a 48-bit post-add/sub/accum. Several configurable pipeline registers exist within the block, allowing for higher clock speeds with the trade-off of added latency. Opmode pins allow the block operation to change from one clock-cycle to the next, thus allowing a single block to serve several arithmetic functions within a design. Furthermore, multiple MSP1 blocks can be cascaded to efficiently form larger multiplication and addition functions.

Port Descriptions

Port	Direction	Width	Function
Data Ports			
A	Input	18	18-bit data input to multiplier or post add/sub depending on the value of OPMODE[1:0].
B	Input	18	18-bit data input to multiplier, pre-add/sub and, perhaps, a post-add/sub depending on the value of OPMODE[3:0].

Port	Direction	Width	Function
C	Input	48	48-bit data input to post-add/sub.
D	Input	18	18-bit data input to pre-add/sub.
CARRYIN	Input	1	External carry input to the post-add/sub. Should only be connected to the CARRYOUT pin of another DSP48A block.
P	Output	48	Primary data output.
CARRYOUT	Output	1	Carry out signal for post-add/sub. Should only be connected to the CARRYIN pin of another DSP48A.
Control Inputs			
CLK	Input	1	DSP48A clock
OPMODE	Input	8	Control input to select the arithmetic operations of the DSP48A.
OPMODE[1:0]			Specifies the source of the X input to the post-add/sub • 0 - Specifies to place all zeroes (disable the post-add/sub). • 1 - Use the POUT output signal. • 2 - Use the concatenated D, B, A input signals. • 3 - Use the multiplier product.
OPMODE[3:2]			Specifies the source of the Y input to the post-add/sub • 0 - Specifies to place all zeroes (disable the post-add/sub and propagate the multiplier product to POUT). • 1 - Use the PCIN. • 2 - Use the POUT port (accumulator). • 3 - Use the C port.
OPMODE[4]			Specifies the use of the pre-add/sub • 0 - Selects to use the pre-adder adding or subtracting the values on the B and D ports prior to the multiplier. • 1 - Bypass the pre-adder, supplying the data on Port B directly to the multiplier.
OPMODE[5]			Force a value on carry-in to the post-adder. Only applicable when CARRYINSEL = "OPMODE5".
OPMODE[6]			Specifies whether the pre-add/sub is an adder or subtracter • 0 - Specifies pre-add/sub to perform an addition operation. • 1 - Specifies pre-add/sub to perform a subtract operation.
OPMODE[7]			Specifies whether the post-add/sub is an adder or subtracter • 0 - Specifies post-add/sub to perform an addition operation. • 1 - Specifies post-add/sub to perform a subtract operation.
Reset/Clock Enable Inputs			
RSTA	Input	1	Active high, reset for the A port registers (A0REG = 1 or A1REG = 1). Tie to logic zero if not used. This reset is configurable to be synchronous or asynchronous, depending on the value of the RSTTYPE attribute.
RSTB	Input	1	Active high, reset for the B port registers (B0REG = 1 or B1REG = 1). Tie to logic zero if not used. This reset is configurable to be synchronous or asynchronous depending on the value of the RSTTYPE attribute.

Port	Direction	Width	Function
RSTC	Input	1	Active high, reset for the C port registers (CREG=1). Tie to logic zero if not used. This reset is configurable to be synchronous or asynchronous depending on the value of the RSTTYPE attribute.
RSTD	Input	1	Active high, reset for the D port registers (DREG=1). Tie to logic zero if not used. This reset is configurable to be synchronous or asynchronous depending on the value of the RSTTYPE attribute.
RSTM	Input	1	Active high, reset for the multiplier registers (MREG=1). Tie to logic zero if not used. This reset is configurable to be synchronous or asynchronous depending on the value of the RSTTYPE attribute.
RSTP	Input	1	Active high, reset for the P output registers (PREG=1). Tie to logic zero if not used. This reset is configurable to be synchronous or asynchronous depending on the value of the RSTTYPE attribute.
RSTCARRYIN	Input	1	Active high, reset for the carry-in register (CARRYINREG =1). Tie to logic zero if not used. This reset is configurable to be synchronous or asynchronous depending on the value of the RSTTYPE attribute.
RSTOPMODE	Input	1	Active High, reset for the OPMODE registers (OPMODEREG=1). Tie to logic zero if not used. This reset is configurable to be synchronous or asynchronous depending on the value of the RSTTYPE attribute.
CEA	Input	1	Active High, clock enable for the A port registers (A0REG = 1 or A1REG = 1). Tie to logic one if not used and A0REG = 1 or A1REG = 1.Tie to logic zero if A0REG = 0, and A1REG = 0.
CEB	Input	1	Active High, clock enable for the B port registers (B0REG = 1 or B1REG = 1). Tie to logic one if not used and B0REG = 1 or B1REG = 1. Tie to logic zero if B0REG = 0 and B1REG = 0.
CEC	Input	1	Active high, clock enable for the C port registers (CREG=1). Tie to logic one if not used and CREG=1. Tie to a logic zero if CREG=0.
CED	Input	1	Active high, clock enable for the D port registers (DREG=1). Tie to logic one if not used and DREG=1. Tie to a logic zero if DREG=0.
CEM	Input	1	Active high, clock enable for the multiplier registers (MREG=1). Tie to logic one if not used and MREG=1. Tie to a logic zero if MREG=0.
CEP	Input	1	Active high, clock enable for the output port registers (PREG=1). Tie to logic one if not used and PREG=1. Tie to a logic zero if PREG=0.
CECARRYIN	Input	1	Active high, clock enable for the carry-in registers (CARRYINREG=1). Tie to logic one if not used and CARRYINREG=1. Tie to a logic zero if CARRINREG=0.
CEOPMODE	Input	1	Clock enable for the OPMODE input registers (OPMODEREG=1). Tie to logic one if not used and OPMODEREG=1. Tie to a logic zero if OPMODEREG=0.
Cascade Ports			
PCIN	Input	48	Cascade input for Port P. If used, connect to PCOUT of upstream cascaded DSP48A. If not used, tie port to all zeros.
PCOUT	Output	48	Cascade output for Port P. If used, connect to PCIN of downstream cascaded DSP48A. If not used, leave unconnected.
BCOUT	Output	18	Cascade output for Port B. If used, connect to the B port of downstream cascaded DSP48A. If not used, leave unconnected.

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
A0REG	Integer	0, 1	0	Selects whether to register the first stage A input to the DSP48A.
A1REG	Integer	0, 1	1	Selects whether to register the second stage A input to the DSP48A.
B0REG	Integer	0, 1	0	Selects whether to register the first stage B input to the DSP48A.
B1REG	Integer	0, 1	1	Selects whether to register the second stage B input to the DSP48A.
CARRYINREG	Integer	0, 1	1	Selects whether to register the CARRYIN input to the DSP48A. This should only be used when CARRYINSEL is set to "CARRYIN" and the CARRYIN pin is used.
CARRYINSEL	String	"CARRYIN", "OPMODE5"	"CARRYIN"	Selects whether the post add/sub carry-in signal should be sourced from the CARRYIN pin (connected to the CARRYOUT of another DSP48A) or dynamically controlled from the FPGA fabric by the OPMODE[5] input.
CREG	Integer	0, 1	1	Selects whether to register the C input to the DSP48A.
DREG	Integer	0, 1	1	Selects whether to register the D input to the DSP48A.
MREG	Integer	0, 1	1	Selects whether to register the multiplier stage of the DSP48A. Enable=1/disable=0.
OPMODEREG	Integer	0, 1	1	Selects whether to register the OPMODE inputs to the DSP48A.
PREG	Integer	0, 1	1	Selects whether to register the C input to the DSP48A.
RSTTYPE	String	"ASYNC", "SYNC"	"SYNC"	Selects whether all resets for the DSP48A should have a synchronous or asynchronous reset capability. Due to improved timing and circuit stability, it is recommended to always have this set to "SYNC" unless an asynchronous reset is absolutely necessary.

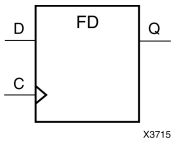
FD

Primitive: D Flip-Flop



Introduction

This design element is a D-type flip-flop with data input (D) and data output (Q). The data on the D inputs is loaded into the flip-flop during the Low-to-High clock (C) transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
D	**C**	**Q**
0	↑	0
1	↑	1

Design Entry Method

This design element is only for use in schematics.

Available Attributes

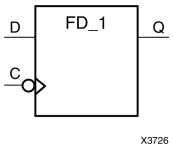
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FD_1

Primitive: D Flip-Flop with Negative-Edge Clock



Introduction

This design element is a single D-type flip-flop with data input (D) and data output (Q). The data on the (D) input is loaded into the flip-flop during the High-to-Low clock (C) transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
D	C	Q
0	↓	0
1	↓	1

Design Entry Method

This design element is only for use in schematics.

Available Attributes

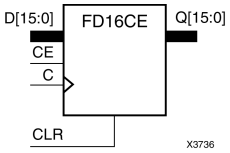
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FD16CE

Macro: 16-Bit Data Register with Clock Enable and Asynchronous Clear



Introduction

This design element is a 16-bit data register with clock enable and asynchronous clear. When clock enable (CE) is High and asynchronous clear (CLR) is Low, the data on the data inputs (D) is transferred to the corresponding data outputs (Q) during the Low-to-High clock (C) transition. When CLR is High, it overrides all other inputs and resets the data outputs (Q) Low. When CE is Low, clock transitions are ignored.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				**Outputs**
CLR	**CE**	**Dz : D0**	**C**	**Qz : Q0**
1	X	X	X	0
0	0	X	X	No Change
0	1	Dn	↑	Dn
z = bit-width - 1				

Design Entry Method

This design element is only for use in schematics.

Available Attributes

Attribute	**Type**	**Allowed Values**	**Default**	**Description**
INIT	Binary	Any 16-bit Value	All zeros	Sets the initial value of Q output after configuration

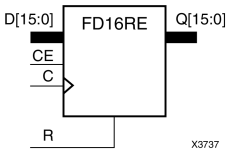
FD16RE

Macro: 16-Bit Data Register with Clock Enable and Synchronous Reset



Introduction

This design element is a 16-bit data registers. When the clock enable (CE) input is High, and the synchronous reset (R) input is Low, the data on the data inputs (D) is transferred to the corresponding data outputs (Q0) during the Low-to-High clock (C) transition. When R is High, it overrides all other inputs and resets the data outputs (Q) Low on the Low-to-High clock transition. When CE is Low, clock transitions are ignored.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs
R	**CE**	**Dz : D0**	**C**	**Qz : Q0**
1	X	X	↑	0
0	0	X	X	No Change
0	1	Dn	↑	Dn
z = bit-width - 1				

Design Entry Method

This design element is only for use in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	Any 16-bit Value	All zeros	Sets the initial value of Q output after configuration

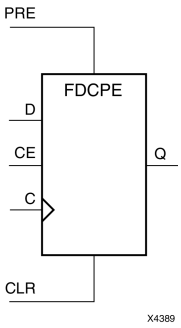
FDCPE

Primitive: D Flip-Flop with Clock Enable and Asynchronous Preset and Clear



Introduction

This design element is a single D-type flip-flop with data (D), clock enable (CE), asynchronous preset (PRE), and asynchronous clear (CLR) inputs. The asynchronous active high PRE sets the Q output High; that active high CLR resets the output Low and has precedence over the PRE input. Data on the D input is loaded into the flip-flop when PRE and CLR are Low and CE is High on the Low-to-High clock (C) transition. When CE is Low, the clock transitions are ignored and the previous value is retained. The FDCPE is generally implemented as a slice or IOB register within the device.

For FPGA devices, upon power-up, the initial value of this component is specified by the INIT attribute. If a subsequent GSR (Global Set/Reset) is asserted, the flop is asynchronously set to the INIT value.

Note While this device supports the use of asynchronous set and reset, it is not generally recommended to be used for in most cases. Use of asynchronous signals pose timing issues within the design that are difficult to detect and control and also have an adverse affect on logic optimization causing a larger design that can consume more power than if a synchronous set or reset is used.

Logic Table

Inputs					Outputs
CLR	**PRE**	**CE**	**D**	**C**	**Q**
1	X	X	X	X	0
0	1	X	X	X	1
0	0	0	X	X	No Change
0	0	1	D	↑	D

Port Descriptions

Port	Direction	Width	Function
Q	Output	1	Data output
C	Input	1	Clock input
CE	Input	1	Clock enable input
CLR	Input	1	Asynchronous clear input
D	Input	1	Data input
PRE	Input	1	Asynchronous set input

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0,1	0	Sets the initial value of Q output after configuration and on GSR.

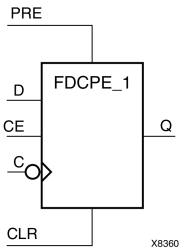
FDCPE_1

Primitive: D Flip-Flop with Negative-Edge Clock, Clock Enable, and Asynchronous Preset and Clear



Introduction

FDCPE_1 is a single D-type flip-flop with data (D), clock enable (CE), asynchronous preset (PRE), and asynchronous clear (CLR) inputs and data output (Q). The asynchronous PRE, when High, sets the (Q) output High; CLR, when High, resets the output Low. Data on the (D) input is loaded into the flip-flop when PRE and CLR are Low and CE is High on the High-to-Low clock (C) transition. When CE is Low, the clock transitions are ignored.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs					Outputs
CLR	**PRE**	**CE**	**D**	**C**	**Q**
1	X	X	X	X	0
0	1	X	X	X	1
0	0	0	X	X	No Change
0	0	1	D	↓	D

Port Descriptions

Port	Direction	Width	Function
Q	Output	1	Data output
C	Input	1	Clock input
CE	Input	1	Clock enable input
CLR	Input	1	Asynchronous clear input
D	Input	1	Data input
PRE	Input	1	Asynchronous set input

Design Entry Method

This design element can be used in schematics.

Available Attributes

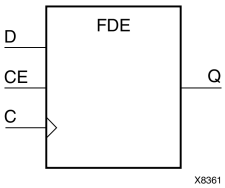
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0,1	0	Sets the initial value of Q output after configuration and on GSR.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FDE

Primitive: D Flip-Flop with Clock Enable



Introduction

This design element is a single D-type flip-flop with data input (D), clock enable (CE), and data output (Q). When clock enable is High, the data on the (D) input is loaded into the flip-flop during the Low-to-High clock (C) transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
CE	**D**	**C**	**Q**
0	X	X	No Change
1	0	↑	0
1	1	↑	1

Design Entry Method

This design element is only for use in schematics.

Available Attributes

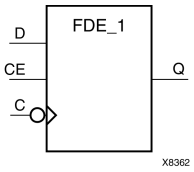
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FDE_1

Primitive: D Flip-Flop with Negative-Edge Clock and Clock Enable



Introduction

This design element is a single D-type flip-flop with data input (D), clock enable (CE), and data output (Q). When clock enable is High, the data on the (D) input is loaded into the flip-flop during the High-to-Low clock (C) transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

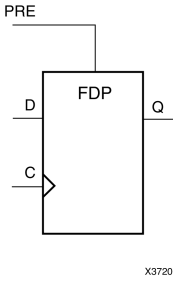
FDP

Primitive: D Flip-Flop with Asynchronous Preset



Introduction

This design element is a single D-type flip-flop with data (D) and asynchronous preset (PRE) inputs and data output (Q). The asynchronous PRE, when High, overrides all other inputs and presets the (Q) output High. The data on the (D) input is loaded into the flip-flop when PRE is Low on the Low-to-High clock (C) transition.

For FPGA devices, this flip-flop is asynchronously preset, output High, when power is applied. Power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
PRE	**C**	**D**	**Q**
1	X	X	1
0	↑	D	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

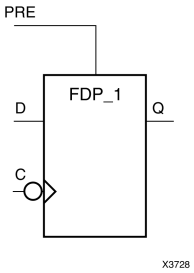
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	1	Sets the initial value of Q output after configuration For Spartan®-6, Xilinx recommends that the INIT value always matches the polarity of the set or reset. For this element, the INIT should be 1. If set to 0, additional asynchronous circuitry will be created to correctly model the behavior.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FDP_1

Primitive: D Flip-Flop with Negative-Edge Clock and Asynchronous Preset



Introduction

This design element is a single D-type flip-flop with data (D) and asynchronous preset (PRE) inputs and data output (Q). The asynchronous PRE, when High, overrides all other inputs and presets the Q output High. The data on the D input is loaded into the flip-flop when PRE is Low on the High-to-Low clock (C) transition.

This flip-flop is asynchronously preset, output High, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
PRE	**C**	**D**	**Q**
1	X	X	1
0	↓	D	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	1	Sets the initial value of Q output after configuration For Spartan®-6, Xilinx recommends that the INIT value always matches the polarity of the set or reset. For this element, the INIT should be 1. If set to 0, additional asynchronous circuitry will be created to correctly model the behavior.

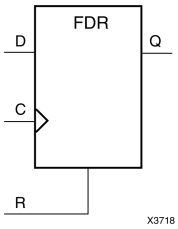
FDR

Primitive: D Flip-Flop with Synchronous Reset



Introduction

This design element is a single D-type flip-flop with data (D) and synchronous reset (R) inputs and data output (Q). The synchronous reset (R) input, when High, overrides all other inputs and resets the (Q) output Low on the Low-to-High clock (C) transition. The data on the (D) input is loaded into the flip-flop when R is Low during the Low-to- High clock transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
R	**D**	**C**	**Q**
1	X	↑	0
0	D	↑	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

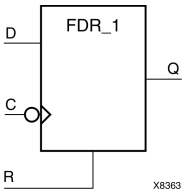
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FDR_1

Primitive: D Flip-Flop with Negative-Edge Clock and Synchronous Reset



Introduction

This design element is a single D-type flip-flop with data (D) and synchronous reset (R) inputs and data output (Q). The synchronous reset (R) input, when High, overrides all other inputs and resets the (Q) output Low on the High-to-Low clock (C) transition. The data on the (D) input is loaded into the flip-flop when R is Low during the High-to- Low clock transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
R	**D**	**C**	**Q**
1	X	↓	0
0	D	↓	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

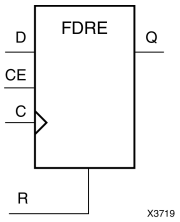
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FDRE

Primitive: D Flip-Flop with Clock Enable and Synchronous Reset



Introduction

This design element is a single D-type flip-flop with data (D), clock enable (CE), and synchronous reset (R) inputs and data output (Q). The synchronous reset (R) input, when High, overrides all other inputs and resets the (Q) output Low on the Low-to-High clock (C) transition. The data on the (D) input is loaded into the flip-flop when R is Low and CE is High during the Low-to-High clock transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs
R	**CE**	**D**	**C**	**Q**
1	X	X	↑	0
0	0	X	X	No Change
0	1	D	↑	D

Design Entry Method

This design element can be used in schematics.

Available Attributes

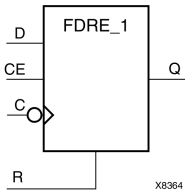
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration For Spartan®-6, the INIT value should always match the polarity of the set or reset. For this element, the INIT should be 0. If set to 1, an asynchronous circuit must be created to exhibit this behavior, which Xilinx does not recommend.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FDRE_1

Primitive: D Flip-Flop with Negative-Clock Edge, Clock Enable, and Synchronous Reset



Introduction

FDRE_1 is a single D-type flip-flop with data (D), clock enable (CE), and synchronous reset (R) inputs and data output (Q). The synchronous reset (R) input, when High, overrides all other inputs and resets the (Q) output Low on the High-to-Low clock (C) transition. The data on the (D) input is loaded into the flip-flop when R is Low and CE is High during the High-to-Low clock transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs
R	**CE**	**D**	**C**	**Q**
1	X	X	↓	0
0	0	X	X	No Change
0	1	D	↓	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration For Spartan®-6, the INIT value should always match the polarity of the set or reset. For this element, the INIT should be 0. If set to 1, an asynchronous circuit must be created to exhibit this behavior, which Xilinx does not recommend.

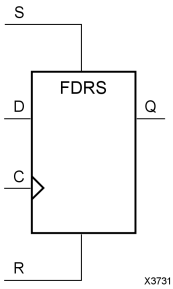
FDRS

Primitive: D Flip-Flop with Synchronous Reset and Set



Introduction

FDRS is a single D-type flip-flop with data (D), synchronous set (S), and synchronous reset (R) inputs and data output (Q). The synchronous reset (R) input, when High, overrides all other inputs and resets the (Q) output Low during the Low-to-High clock (C) transition. (Reset has precedence over Set.) When S is High and R is Low, the flip-flop is set, output High, during the Low-to-High clock transition. When R and S are Low, data on the (D) input is loaded into the flip-flop during the Low-to-High clock transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs
R	**S**	**D**	**C**	**Q**
1	X	X	↓	0
0	1	X	↓	1
0	0	D	↓	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

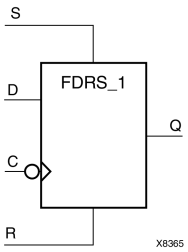
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FDRS_1

Primitive: D Flip-Flop with Negative-Clock Edge and Synchronous Reset and Set



Introduction

FDRS_1 is a single D-type flip-flop with data (D), synchronous set (S), and synchronous reset (R) inputs and data output (Q). The synchronous reset (R) input, when High, overrides all other inputs and resets the (Q) output Low during the High-to-Low clock (C) transition. (Reset has precedence over Set.) When S is High and R is Low, the flip-flop is set, output High, during the High-to-Low clock transition. When R and S are Low, data on the (D) input is loaded into the flip-flop during the High-to-Low clock transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs
R	**S**	**D**	**C**	**Q**
1	X	X	↓	0
0	1	X	↓	1
0	0	D	↓	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration

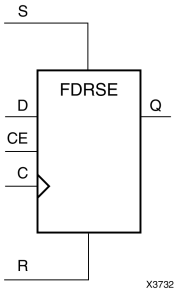
FDRSE

Primitive: D Flip-Flop with Synchronous Reset and Set and Clock Enable



Introduction

FDRSE is a single D-type flip-flop with synchronous reset (R), synchronous set (S), clock enable (CE) inputs. The reset (R) input, when High, overrides all other inputs and resets the Q output Low during the Low-to-High clock transition. (Reset has precedence over Set.) When the set (S) input is High and R is Low, the flip-flop is set, output High, during the Low-to-High clock (C) transition. Data on the D input is loaded into the flip-flop when R and S are Low and CE is High during the Low-to-High clock transition.

Upon power-up, the initial value of this component is specified by the INIT attribute. If a subsequent GSR (Global Set/Reset) is asserted, the flop is asynchronously set to the INIT value.

Logic Table

Inputs					Outputs
R	**S**	**CE**	**D**	**C**	**Q**
1	X	X	X	↑	0
0	1	X	X	↑	1
0	0	0	X	X	No Change
0	0	1	1	↑	1
0	0	1	0	↑	0

Design Entry Method

This design element can be used in schematics.

Available Attributes

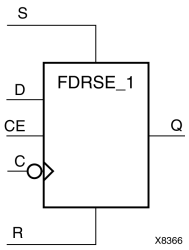
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0,1	0	Sets the initial value of Q output after configuration and on GSR.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FDRSE_1

Primitive: D Flip-Flop with Negative-Clock Edge, Synchronous Reset and Set, and Clock Enable



Introduction

FDRSE_1 is a single D-type flip-flop with synchronous reset (R), synchronous set (S), and clock enable (CE) inputs and data output (Q). The reset (R) input, when High, overrides all other inputs and resets the (Q) output Low during the High-to-Low clock transition. (Reset has precedence over Set.) When the set (S) input is High and R is Low, the flip-flop is set, output High, during the High-to-Low clock (C) transition. Data on the (D) input is loaded into the flip-flop when (R) and (S) are Low and (CE) is High during the High-to-Low clock transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs					Outputs
R	**S**	**CE**	**D**	**C**	**Q**
1	X	X	X	↓	0
0	1	X	X	↓	1
0	0	0	X	X	No Change
0	0	1	D	↓	D

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0,1	0	Sets the initial value of Q output after configuration and on GSR.

For More Information

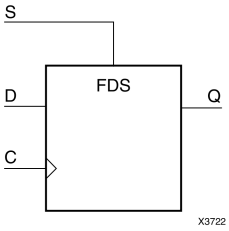
FDS

Primitive: D Flip-Flop with Synchronous Set



Introduction

FDS is a single D-type flip-flop with data (D) and synchronous set (S) inputs and data output (Q). The synchronous set input, when High, sets the Q output High on the Low-to-High clock (C) transition. The data on the D input is loaded into the flip-flop when S is Low during the Low-to-High clock (C) transition.

For FPGA devices, this flip-flop is asynchronously preset, output High, when power is applied. Power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
S	**D**	**C**	**Q**
1	X	↑	1
0	D	↑	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

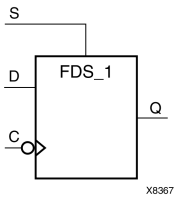
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	1	Sets the initial value of Q output after configuration.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

FDS_1

Primitive: D Flip-Flop with Negative-Edge Clock and Synchronous Set



Introduction

FDS is a single D-type flip-flop with data (D) and synchronous set (S) inputs and data output (Q). The synchronous set input, when High, sets the Q output High on the Low-to-High clock (C) transition. The data on the D input is loaded into the flip-flop when S is Low during the Low-to-High clock (C) transition.

This flip-flop is asynchronously preset, output High, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
S	**D**	**C**	**Q**
1	X	↓	1
0	D	↓	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	1	Sets the initial value of Q output after configuration.

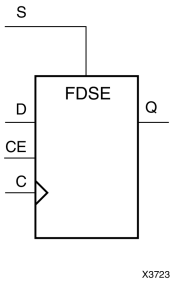
FDSE

Primitive: D Flip-Flop with Clock Enable and Synchronous Set



Introduction

FDSE is a single D-type flip-flop with data (D), clock enable (CE), and synchronous set (S) inputs and data output (Q). The synchronous set (S) input, when High, overrides the clock enable (CE) input and sets the Q output High during the Low-to-High clock (C) transition. The data on the D input is loaded into the flip-flop when S is Low and CE is High during the Low-to-High clock (C) transition.

For FPGA devices, this flip-flop is asynchronously preset, output High, when power is applied. Power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs
S	**CE**	**D**	**C**	**Q**
1	X	X	↑	1
0	0	X	X	No Change
0	1	D	↑	D

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	1	Sets the initial value of Q output after configuration For Spartan®-6, Xilinx recommends that the INIT value always matches the polarity of the set or reset. For this element, the INIT should be 1. If set to 0, additional asynchronous circuitry will be created to correctly model the behavior.

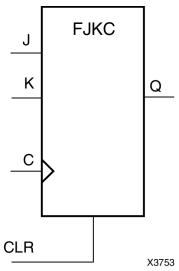
FJKC

Macro: J-K Flip-Flop with Asynchronous Clear



Introduction

This design element is a single J-K-type flip-flop with J, K, and asynchronous clear (CLR) inputs and data output (Q). The asynchronous clear (CLR) input, when High, overrides all other inputs and resets the Q output Low. When CLR is Low, the output responds to the state of the J and K inputs, as shown in the following logic table, during the Low-to-High clock (C) transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs
CLR	**J**	**K**	**C**	**Q**
1	X	X	X	0
0	0	0	↑	No Change
0	0	1	↑	0
0	1	0	↑	1
0	1	1	↑	Toggle

Design Entry Method

This design element is only for use in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration For Spartan®-6, the INIT value should always match the polarity of the set or reset. For this element, the INIT should be 0. If set to 1, an asynchronous circuit must be created to exhibit this behavior, which Xilinx does not recommend.

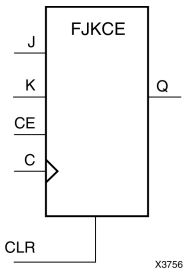
FJKCE

Macro: J-K Flip-Flop with Clock Enable and Asynchronous Clear



Introduction

This design element is a single J-K-type flip-flop with J, K, clock enable (CE), and asynchronous clear (CLR) inputs and data output (Q). The asynchronous clear (CLR), when High, overrides all other inputs and resets the Q output Low. When CLR is Low and CE is High, Q responds to the state of the J and K inputs, as shown in the following logic table, during the Low-to-High clock transition. When CE is Low, the clock transitions are ignored.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs					Outputs
CLR	**CE**	**J**	**K**	**C**	**Q**
1	X	X	X	X	0
0	0	X	X	X	No Change
0	1	0	0	X	No Change
0	1	0	1	↑	0
0	1	1	0	↑	1
0	1	1	1	↑	Toggle

Design Entry Method

This design element is only for use in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration For Spartan®-6, the INIT value should always match the polarity of the set or reset. For this element, the INIT should be 0. If set to 1, an asynchronous circuit must be created to exhibit this behavior, which Xilinx does not recommend.

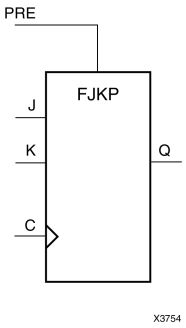
Macro: J-K Flip-Flop with Asynchronous Preset



Introduction

This design element is a single J-K-type flip-flop with J, K, and asynchronous preset (PRE) inputs and data output (Q). The asynchronous preset (PRE) input, when High, overrides all other inputs and sets the (Q) output High. When (PRE) is Low, the (Q) output responds to the state of the J and K inputs, as shown in the following logic table, during the Low-to-High clock transition.

For FPGA devices, this flip-flop is asynchronously preset, output High, when power is applied. Power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs
PRE	**J**	**K**	**C**	**Q**

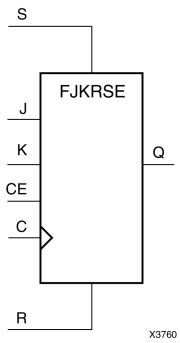
Macro: J-K Flip-Flop with Clock Enable and Synchronous Reset and Set



Introduction

This design element is a single J-K-type flip-flop with J, K, synchronous reset (R), synchronous set (S), and clock enable (CE) inputs and data output (Q). When synchronous reset (R) is High during the Low-to-High clock (C) transition, all other inputs are ignored and output (Q) is reset Low. When synchronous set (S) is High and (R) is Low, output (Q) is set High. When (R) and (S) are Low and (CE) is High, output (Q) responds to the state of the J and K inputs, according to the following logic table, during the Low-to-High clock (C) transition. When (CE) is Low, clock transitions are ignored.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs						Outputs
R	**S**	**CE**	**J**	**K**	**C**	**Q**

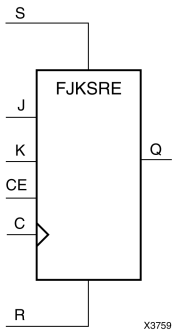
Macro: J-K Flip-Flop with Clock Enable and Synchronous Set and Reset



Introduction

This design element is a single J-K-type flip-flop with J, K, synchronous set (S), synchronous reset (R), and clock enable (CE) inputs and data output (Q). When synchronous set (S) is High during the Low-to-High clock (C) transition, all other inputs are ignored and output (Q) is set High. When synchronous reset (R) is High and (S) is Low, output (Q) is reset Low. When (S) and (R) are Low and (CE) is High, output (Q) responds to the state of the J and K inputs, as shown in the following logic table, during the Low-to-High clock (C) transition. When (CE) is Low, clock transitions are ignored.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs						Outputs
S	**R**	**CE**	**J**	**K**	**C**	**Q**

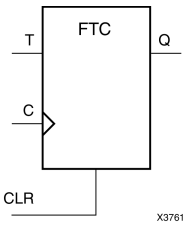
Macro: Toggle Flip-Flop with Asynchronous Clear



Introduction

This design element is a synchronous, resettable toggle flip-flop. The asynchronous clear (CLR) input, when High, overrides all other inputs and resets the data output (Q) Low. The (Q) output toggles, or changes state, when the toggle enable (T) input is High and (CLR) is Low during the Low-to-High clock transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
CLR	**T**	**C**	**Q**
1	X	X	0
0	0	X	No Change
0	1	↑	Toggle

Design Entry Method

You can instantiate this element when targeting a CPLD, but not when you are targeting an FPGA.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration For Spartan®-6, the INIT value should always match the polarity of the set or reset. For this element, the INIT should be 0. If set to 1, an asynchronous circuit must be created to exhibit this behavior, which Xilinx does not recommend.

GND

Primitive: Ground-Connection Signal Tag

Introduction

The GND signal tag, or parameter, forces a net or input function to a Low logic level. A net tied to GND cannot have any other source.

When the logic-trimming software or fitter encounters a net or input function tied to GND, it removes any logic that is disabled by the GND signal. The GND signal is only implemented when the disabled logic cannot be removed.

Design Entry Method

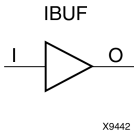
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IBUF

Primitive: Input Buffer



Introduction

This design element is automatically inserted (inferred) by the synthesis tool to any signal directly connected to a top-level input or in-out port of the design. You should generally let the synthesis tool infer this buffer. However, it can be instantiated into the design if required. In order to do so, connect the input port (I) directly to the associated top-level input or in-out port, and connect the output port (O) to the logic sourced by that port. Modify any necessary generic maps (VHDL) or named parameter value assignment (Verilog) in order to change the default behavior of the component.

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Buffer output
I	Input	1	Buffer input

Design Entry Method

This design element can be used in schematics.

This element is usually inferred by the synthesis tool for any specified top-level input port to the design, and therefore it is generally not necessary to specify the element in source code. However, if desired, this element may be manually instantiated by copying the instantiation code from below and pasting it into the top-level entity/module of your code. Xilinx recommends that you put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level input port of the design and the O port to the logic in which this input is to source. Specify the desired generic/defparam values in order to configure the proper behavior of the buffer.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
IBUF_DELAY_VALUE	String	"0" through "16"	"0"	Specifies the amount of additional delay to add to the non-registered path out of the IOB.
IFD_DELAY_VALUE	String	"AUTO", "0" through "8"	"AUTO"	Specifies the amount of additional delay to add to the registered path within the IOB.
IOSTANDARD	String	See Data Sheet.	"DEFAULT"	Assigns an I/O standard to the element.

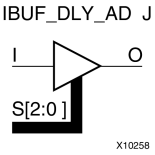
IBUF_DLY_ADJ

Primitive: Dynamically Adjustable Input Delay Buffer



Introduction

This design element is an input buffer with an adjustable delay element allowing dynamic delay adjustment (delay tuning) of an input signal into the FPGA. This is particularly useful for data aligning and capturing of high-speed input signals into the FPGA over process, voltage, and temperature variations. This component consists of a 3-bit select bus, which allows 8 unique values of delay to be added to the incoming signal. Additionally, the component can be programmed with a delay offset to delay adjustment within either the lower 8 or upper 8 of the 16 contiguous delay values.

See "For More Information" for details on the amount of delay and further details about usage of this component.

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Delayed output from the buffer
I	Input	1	Differential input data (positive)
IB	Input	1	Differential input data (negative)
S	Input	3	Dynamic delay adjustment select lines

Design Entry Method

This design element can be used in schematics.

Available Attributes

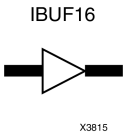
Attribute	Type	Allowed Values	Default	Description
DELAY_ OFFSET	String	"OFF", "ON"	"OFF"	When set to "OFF", the IBUFDS_DLY_ADJ operates at the lower range of delay values. This should be used when a smaller amount of additional delay is needed. When set to "ON", the component operates at the upper (longer) range of delay values. This should be used when a larger amount of additional delay is needed.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IBUF16

Macro: 16-Bit Input Buffer



Introduction

Input Buffers isolate the internal circuit from the signals coming into the chip. This design element is contained in input/output blocks (IOBs) and allows the specification of the particular I/O Standard to configure the I/O. In general, an this element should be used for all single-ended data input or bidirectional pins.

Design Entry Method

This design element can be used in schematics.

This element is usually inferred by the synthesis tool for any specified top-level input port to the design, and therefore it is generally not necessary to specify the element in source code. However, if desired, this element may be manually instantiated by copying the instantiation code from below and pasting it into the top-level entity/module of your code. Xilinx recommends that you put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level input port of the design and the O port to the logic in which this input is to source. Specify the desired generic/defparam values in order to configure the proper behavior of the buffer.

Available Attributes

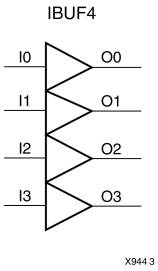
Attribute	Type	Allowed Values	Default	Description
IBUF_DELAY_VALUE	String	"0" through "16"	"0"	Specifies the amount of additional delay to add to the non-registered path out of the IOB.
IFD_DELAY_VALUE	String	"AUTO", "0" through "8"	"AUTO"	Specifies the amount of additional delay to add to the registered path within the IOB.
IOSTANDARD	String	See Data Sheet.	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IBUF4

Macro: 4-Bit Input Buffer



Introduction

Input Buffers isolate the internal circuit from the signals coming into the chip. This design element is contained in input/output blocks (IOBs) and allows the specification of the particular I/O Standard to configure the I/O. In general, an this element should be used for all single-ended data input or bidirectional pins.

Design Entry Method

This design element can be used in schematics.

This element is usually inferred by the synthesis tool for any specified top-level input port to the design, and therefore it is generally not necessary to specify the element in source code. However, if desired, this element may be manually instantiated by copying the instantiation code from below and pasting it into the top-level entity/module of your code. Xilinx recommends that you put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level input port of the design and the O port to the logic in which this input is to source. Specify the desired generic/defparam values in order to configure the proper behavior of the buffer.

Available Attributes

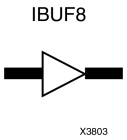
Attribute	Type	Allowed Values	Default	Description
IBUF_DELAY_VALUE	String	"0" through "16"	"0"	Specifies the amount of additional delay to add to the non-registered path out of the IOB.
IFD_DELAY_VALUE	String	"AUTO", "0" through "8"	"AUTO"	Specifies the amount of additional delay to add to the registered path within the IOB.
IOSTANDARD	String	See Data Sheet.	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IBUF8

Macro: 8-Bit Input Buffer



Introduction

Input Buffers isolate the internal circuit from the signals coming into the chip. This design element is contained in input/output blocks (IOBs) and allows the specification of the particular I/O Standard to configure the I/O. In general, an this element should be used for all single-ended data input or bidirectional pins.

Design Entry Method

This design element can be used in schematics.

This element is usually inferred by the synthesis tool for any specified top-level input port to the design, and therefore it is generally not necessary to specify the element in source code. However, if desired, this element may be manually instantiated by copying the instantiation code from below and pasting it into the top-level entity/module of your code. Xilinx recommends that you put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level input port of the design and the O port to the logic in which this input is to source. Specify the desired generic/defparam values in order to configure the proper behavior of the buffer.

Available Attributes

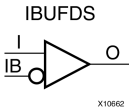
Attribute	Type	Allowed Values	Default	Description
IBUF_DELAY_VALUE	String	"0" through "16"	"0"	Specifies the amount of additional delay to add to the non-registered path out of the IOB.
IFD_DELAY_VALUE	String	"AUTO", "0" through "8"	"AUTO"	Specifies the amount of additional delay to add to the registered path within the IOB.
IOSTANDARD	String	See Data Sheet.	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IBUFDS

Primitive: Differential Signaling Input Buffer



Introduction

This design element is an input buffer that supports low-voltage, differential signaling. In IBUFDS, a design level interface signal is represented as two distinct ports (I and IB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N). Optionally, a programmable differential termination feature is available to help improve signal integrity and reduce external components.

Logic Table

Inputs		Outputs
I	**IB**	**O**
0	0	No Change
0	1	0
1	0	1
1	1	No Change

Port Descriptions

Port	Type	Width	Function
I	Input	1	Diff_p Buffer Input
IB	Input	1	Diff_n Buffer Input
O	Output	1	Buffer Output

Design Entry Method

This design element can be used in schematics.

Put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level "master" input port of the design, the IB port to the top-level "slave" input port, and the O port to the logic in which this input is to source. Specify the desired generic/defparam values in order to configure the proper behavior of the buffer.

Available Attributes

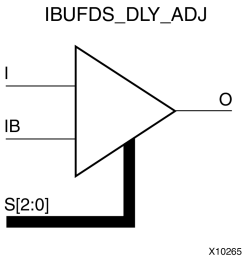
Attribute	Type	Allowed Values	Default	Description
DIFF_TERM	Boolean	TRUE or FALSE	FALSE	Enables the built-in differential termination resistor.
IBUF_DELAY_VALUE	String	"0" through "16"	"0"	Specifies the amount of additional delay to add to the non-registered path out of the IOB.
IFD_DELAY_VALUE	String	"AUTO", "0" thru "8"	"AUTO"	Specifies the amount of additional delay to add to the registered path within the IOB.
IOSTANDARD	String	See Data Sheet.	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IBUFDS_DLY_ADJ

Primitive: Dynamically Adjustable Differential Input Delay Buffer



Introduction

This design element is a differential input buffer with an adjustable delay element allowing dynamic delay adjustment (delay tuning) of an input signal into the FPGA. This is particularly useful for data aligning and capturing of high-speed input signals into the FPGA over process, voltage, and temperature variations. This component consists of a 3-bit select bus, which allows 8 unique values of delay to be added to the incoming signal. Additionally, the component can be programmed with a delay offset to delay adjustment within either the lower 8 or upper 8 of the 16 contiguous delay values.

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Delayed output from the buffer
I	Input	1	Differential input data (positive)
IB	Input	1	Differential input data (negative)
S	Input	3	Dynamic delay adjustment select lines

Design Entry Method

Available Attributes

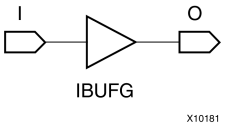
Attribute	Type	Allowed Values	Default	Description
DELAY_ OFFSET	String	"OFF", "ON"	"OFF"	When set to OFF", the IBUFDS_DLY_ADJ operates at the lower range of delay values. This should be used when a smaller amount of additional delay is needed. When set to "ON", the component operates at the upper (longer) range of delay values. This should be used when a larger amount of additional delay is needed.
DIFF_TERM	Boolean	TRUE, FALSE	FALSE	Specifies the procedure for enabling or disabling (default) the internal differential termination capability.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IBUFG

Primitive: Dedicated Input Clock Buffer



Introduction

The IBUFG is a dedicated input to the device which should be used to connect incoming clocks to the FPGA's global clock routing resources. The IBUFG provides dedicated connections to the DCM_SP and BUFG providing the minimum amount of clock delay and jitter to the device. The IBUFG input can only be driven by the global clock pins. The IBUFG output can drive CLKIN of a DCM_SP, BUFG, or your choice of logic.

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Clock Buffer output
I	Input	1	Clock Buffer input

Design Entry Method

This design element can be used in schematics.

Available Attributes

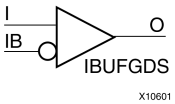
Attribute	Type	Allowed Values	Default	Description
IBUF_DELAY_VALUE	String	"0" through "16"	"0"	Specifies the amount of additional delay to add to the non-registered path out of the IOB
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IBUFGDS

Primitive: Differential Signaling Dedicated Input Clock Buffer and Optional Delay



Introduction

This design element is a dedicated differential signaling input buffer for connection to the clock buffer (BUFG) or DCM. In IBUFGDS, a design-level interface signal is represented as two distinct ports (I and IB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N). Optionally, a programmable differential termination feature is available to help improve signal integrity and reduce external components. Also available is a programmable delay is to assist in the capturing of incoming data to the device.

Logic Table

Inputs		Outputs
I	**IB**	**O**
0	0	No Change
0	1	0
1	0	1
1	1	No Change

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Clock Buffer output
IB	Input	1	Diff_n Clock Buffer Input
I	Input	1	Diff_p Clock Buffer Input

Design Entry Method

This design element can be used in schematics.

Put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level "master" input port of the design, the IB port to the top-level "slave" input port and the O port to a DCM, BUFG or logic in which this input is to source. Some synthesis tools infer the BUFG automatically if necessary, when connecting an IBUFG to the clock resources of the FPGA. Specify the desired generic/defparam values in order to configure the proper behavior of the buffer.

Available Attributes

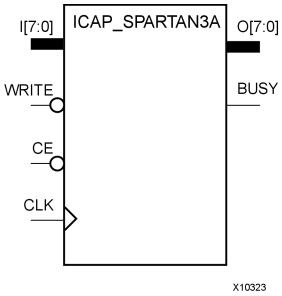
Attribute	Type	Allowed Values	Default	Description
DIFF_TERM	Boolean	TRUE or FALSE	FALSE	Enables the built-in differential termination resistor.
IBUF_DELAY_VALUE	String	"0" through "16"	"0"	Specifies the amount of additional delay to add to the non-registered path out of the IOB
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ICAP_SPARTAN3A

Primitive: Internal Configuration Access Port



Introduction

This primitive works similar to the Slave Parallel (SelectMAP) configuration interface except it is available to the FPGA application using internal routing connections. Furthermore, the ICAP primitive has separate read and write data ports, as opposed to the bidirectional bus on the Slave Parallel (SelectMAP) interface. ICAP allows the FPGA application to access configuration registers, readback configuration data, or to trigger a MultiBoot event after configuration successfully completes.

Port Descriptions

Port	Direction	Width	Function
O	Output	8	Configuration data output bus
Busy	Output	8	Busy output
I	Input	8	Configuration data input bus
WRITE	Input	8	Active Low Write input
CE	Input	8	Active Low Clock Enable Input
CLK	Input	8	Clock Input

Design Entry Method

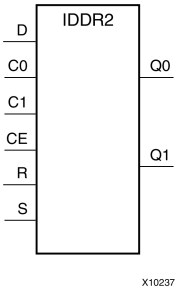
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IDDR2

Primitive: Double Data Rate Input D Flip-Flop with Optional Data Alignment, Clock Enable and Programmable Synchronous or Asynchronous Set/Reset



Introduction

This design element is a dedicated input register designed to receive external dual data rate (DDR) signals into Xilinx® FPGAs. The IDDR2 requires two clocks to be connected to the component, C0 and C1, so that data is captured at the positive edge of both C0 and C1 clocks. The IDDR2 features an active high clock enable port, CE, which be used to suspend the operation of the registers, and both set and reset ports that be configured to be synchronous or asynchronous to the respective clocks. The IDDR2 has an optional alignment feature that allows both output data ports to the component to be aligned to a single clock.

Logic Table

Input						**Output**	
S	R	CE	D	C0	C1	Q0	Q1
1	x	x	x	x	x	INIT_Q0	INIT_Q1
0	1	x	x	x	x	not INIT_Q0	not INIT_Q1
0	0	0	x	x	x	No Change	No Change
0	0	1	D	↑	x	D	No Change
0	0	1	D	x	↑	No Change	D
Set/Reset can be synchronous via SRTYPE value							

Design Entry Method

This design element can be used in schematics.

To change the default behavior of the IDDR2, modify attributes via the generic map (VHDL) or named parameter value assignment (Verilog) as a part of the instantiated component. The IDDR2 can be connected directly to a top-level input port in the design, where an appropriate input buffer can be inferred, or directly to an instantiated IBUF, IOBUF, IBUFDS or IOBUFDS. All inputs and outputs of this component should either be connected or properly tied off.

Available Attributes

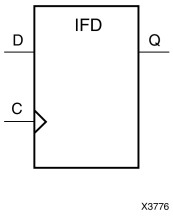
Attribute	Type	Allowed Values	Default	Description
DDR_ALIGNMENT	String	NONE, "C0", "C1"	"NONE"	Sets the output alignment more for the DDR register • NONE - Makes the data available on the Q0 and Q1 outputs shortly after the corresponding C0 or C1 positive clock edge. • C0 – Makes the data on both Q0 and Q1 align to the positive edge of the C0 clock. • C1 - Makes the data on both Q0 and Q1 align to the positive edge of the C1 clock.
INIT_Q0	Integer	0, 1	0	Sets initial state of the Q0 output to 0 or 1.
INIT_Q1	Integer	0, 1	0	Sets initial state of the Q1 output to 0 or 1.
SRTYPE	String	"SYNC", "ASYNC"	"SYNC"	Specifies SYNC" or "ASYNC" set/reset.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IFD

Macro: Input D Flip-Flop



Introduction

This D-type flip-flop is contained in an input/output block (IOB). The input (D) of the flip-flop is connected to an IPAD or an IOPAD (without using an IBUF). The (D) input provides data input for the flip-flop, which synchronizes data entering the chip. The data on input (D) is loaded into the flip-flop during the Low-to-High clock (C) transition and appears at the output (Q). The clock input can be driven by internal logic or through another external pin.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
D	**C**	**Q**
D	↑	D

Design Entry Method

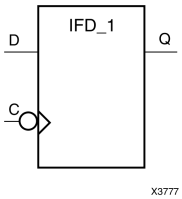
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IFD_1

Macro: Input D Flip-Flop with Inverted Clock (Asynchronous Preset)



Introduction

This design element is a D-type flip flop which is contained in an input/output block (IOB). The input (D) of the flip-flop is connected to an IPAD or an IOPAD. The D input also provides data input for the flip-flop, which synchronizes data entering the chip. The D input data is loaded into the flip-flop during the High-to-Low clock (C) transition and appears at the output (Q). The clock input can be driven by internal logic or through another external pin.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
D	**C**	**Q**
0	↓	0
1	↓	1

Design Entry Method

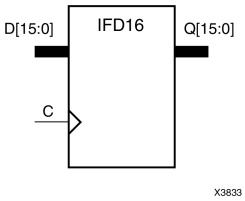
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IFD16

Macro: 16-Bit Input D Flip-Flop



Introduction

This D-type flip-flop is contained in an input/output block (IOB). The input (D) of the flip-flop is connected to an IPAD or an IOPAD (without using an IBUF). The (D) input provides data input for the flip-flop, which synchronizes data entering the chip. The data on input (D) is loaded into the flip-flop during the Low-to-High clock (C) transition and appears at the output (Q). The clock input can be driven by internal logic or through another external pin.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
D	**C**	**Q**
D	↑	D

Design Entry Method

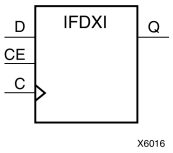
IFDXI

Macro: Input D Flip-Flop with Clock Enable (Asynchronous Preset)



Introduction

The design element is a D-type flip-flop is contained in an input/output block (IOB). The input (D) of the flip-flop is connected to an IPAD or an IOPAD. The D input provides data input for the flip-flop, which synchronizes data entering the chip. When CE is High, the data on input D is loaded into the flip-flop during the Low-to-High clock (C) transition and appears at the output (Q). The clock input can be driven by internal logic or through another external pin. When the CE pin is Low, the output (Q) does not change.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
CE	**D**	**C**	**Q**
1	D	↑	D
0	X	X	No Change

Design Entry Method

This design element is only for use in schematics.

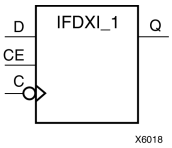
IFDXI_1

Macro: Input D Flip-Flop with Inverted Clock and Clock Enable (Asynchronous Preset)



Introduction

The design element is a D-type flip-flop that is contained in an input/output block (IOB). The input (D) of the flip-flop is connected to an IPAD or an IOPAD. The (D) input provides data input for the flip-flop, which synchronizes data entering the chip. When (CE) is High, the data on input (D) is loaded into the flip-flop during the High-to-Low clock (C) transition and appears at the output (Q). The clock input can be driven by internal logic or through another external pin. When the (CE) pin is Low, the output (Q) does not change.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

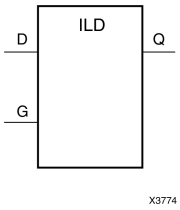
ILD

Macro: Transparent Input Data Latch



Introduction

This design element is a single, transparent data latch that holds transient data entering a chip. This latch is contained in an input/output block (IOB). The latch input (D) is connected to an IPAD or an IOPAD (without using an IBUF). When the gate input (G) is High, data on the input (D) appears on the output (Q). Data on the D input during the High-to-Low G transition is stored in the latch.

This latch is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

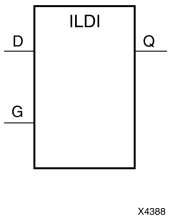
ILDI

Macro: Transparent Input Data Latch (Asynchronous Preset)



Introduction

This design element is a transparent data latch that holds transient data entering a chip. When the gate input (G) is High, data on the input (D) appears on the output (Q). Data on the D input during the High-to-Low G transition is stored in the latch.

The ILDI is the input flip-flop master latch. It is possible to access two different outputs from the input flip-flop: one that responds to the level of the clock signal and another that responds to an edge of the clock signal. When using both outputs from the same input flip-flop, a transparent High latch (ILDI) corresponds to a falling edge-triggered flip-flop (IFDI_1). Similarly, a transparent Low latch (ILDI_1) corresponds to a rising edge-triggered flip-flop (IFDI).

The latch is asynchronously preset, output High, when power is applied.

For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

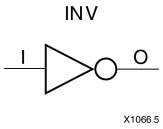
INV

Primitive: Inverter



Introduction

This design element is a single inverter that identifies signal inversions in a schematic.

Design Entry Method

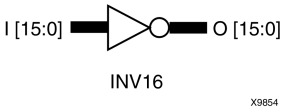
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

INV16

Macro: 16 Inverters



Introduction

This design element is a multiple inverter that identifies signal inversions in a schematic.

Design Entry Method

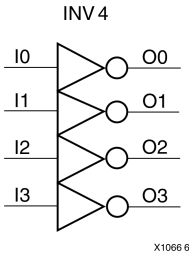
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

INV4

Macro: Four Inverters



Introduction

This design element is a multiple inverter that identifies signal inversions in a schematic.

Design Entry Method

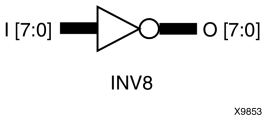
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

INV8

Macro: Eight Inverters



Introduction

This design element is a multiple inverter that identifies signal inversions in a schematic.

Design Entry Method

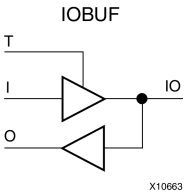
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IOBUF

Primitive: Bi-Directional Buffer



Introduction

The design element is a bidirectional single-ended I/O Buffer used to connect internal logic to an external bidirectional pin.

Logic Table

Inputs		Bidirectional	Outputs
T	**I**	**IO**	**O**
1	X	Z	IO
0	1	1	1
0	0	0	0

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Buffer output
IO	Inout	1	Buffer inout
I	Input	1	Buffer input
T	Input	1	3-State enable input

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
DRIVE	Integer	2, 4, 6, 8, 12, 16, 24	12	Selects output drive strength (mA) for the SelectIO™ buffers that use the LVTTL, LVCMOS12, LVCMOS15, LVCMOS18, LVCMOS25, or LVCMOS33 interface I/O standard.
IBUF_DELAY_VALUE	String	"0" through "16"	"0"	Specifies the amount of additional delay to add to the non-registered path out of the IOB
IFD_DELAY_VALUE	String	"AUTO", "0" through "8"	"AUTO"	Specifies the amount of additional delay to add to the registered path within the IOB

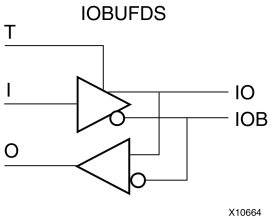
Attribute	Type	Allowed Values	Default	Description
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.
SLEW	String	"SLOW", "FAST", "QUIETIO"	"SLOW"	Sets the output rise and fall time. See the Data Sheet for recommendations of the best setting for this attribute.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

IOBUFDS

Primitive: 3-State Differential Signaling I/O Buffer with Active Low Output Enable



Introduction

The design element is a bidirectional buffer that supports low-voltage, differential signaling. For the IOBUFDS, a design level interface signal is represented as two distinct ports (IO and IOB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N). Optionally, a programmable differential termination feature is available to help improve signal integrity and reduce external components. Also available is a programmable delay is to assist in the capturing of incoming data to the device.

Logic Table

Inputs		Bidirectional		Outputs
I	**T**	**IO**	**IOB**	**O**
X	1	Z	Z	No Change
0	0	0	1	0
I	0	1	0	1

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Buffer output
IO	Inout	1	Diff_p inout
IOB	Inout	1	Diff_n inout
I	Input	1	Buffer input
T	Input	1	3-state enable input

Design Entry Method

This design element can be used in schematics.

Available Attributes

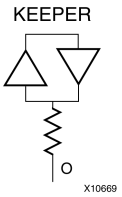
Attribute	Type	Allowed Values	Default	Description
IBUF_DELAY_VALUE	String	"0" through "16"	"0"	Specifies the amount of additional delay to add to the non-registered path out of the IOB
IFD_DELAY_VALUE	String	"AUTO", "0" through "8"	"AUTO"	Specifies the amount of additional delay to add to the registered path within the IOB
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

KEEPER

Primitive: KEEPER Symbol



Introduction

The design element is a weak keeper element that retains the value of the net connected to its bidirectional O pin. For example, if a logic 1 is being driven onto the net, KEEPER drives a weak/resistive 1 onto the net. If the net driver is then 3-stated, KEEPER continues to drive a weak/resistive 1 onto the net.

Port Descriptions

Name	Direction	Width	Function
O	Output	1-Bit	Keeper output

Design Entry Method

This design element can be used in schematics or instantiated in HDL code. Instantiation templates for VHDL and Verilog are available below.

This element can be connected to a net in the following locations on a top-level schematic file:

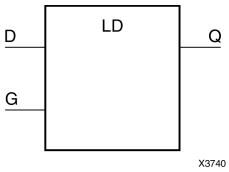
- A net connected to an input IO Marker
- A net connected to both an output IO Marker and 3-statable IO element, such as an OBUFT.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

LD

Primitive: Transparent Data Latch



Introduction

LD is a transparent data latch. The data output (Q) of the latch reflects the data (D) input while the gate enable (G) input is High. The data on the (D) input during the High-to-Low gate transition is stored in the latch. The data on the (Q) output remains unchanged as long as (G) remains Low.

This latch is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
G	**D**	**Q**
1	D	D
0	X	No Change
↓	D	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

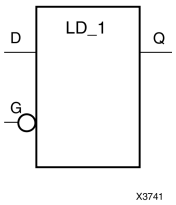
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

LD_1

Primitive: Transparent Data Latch with Inverted Gate



Introduction

This design element is a transparent data latch with an inverted gate. The data output (Q) of the latch reflects the data (D) input while the gate enable (G) input is Low. The data on the (D) input during the Low-to-High gate transition is stored in the latch. The data on the (Q) output remains unchanged as long as (G) remains High.

This latch is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
G	**D**	**Q**
0	D	D
1	X	No Change
↑	D	D

Design Entry Method

This design element is only for use in schematics.

Available Attributes

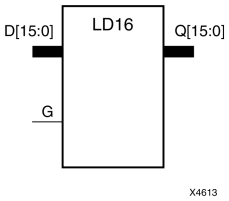
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	0, 1	0	Sets the initial value of Q output after configuration.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

LD16

Macro: Multiple Transparent Data Latch



Introduction

This design element has 16 transparent data latches with a common gate enable (G). The data output (Q) of the latch reflects the data (D) input while the gate enable (G) input is High. The data on the (D) input during the High-to-Low gate transition is stored in the latch. The data on the (Q) output remains unchanged as long as (G) remains Low.

This latch is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
G	**D**	**Q**
1	Dn	Dn
0	X	No Change
↓	Dn	Dn

Design Entry Method

This design element is only for use in schematics.

Available Attributes

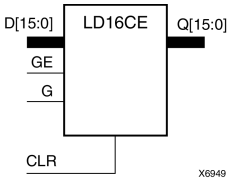
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	Any 16-Bit Value	All zeros	Sets the initial value of Q output after configuration

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

LD16CE

Macro: Transparent Data Latch with Asynchronous Clear and Gate Enable



Introduction

This design element has 16 transparent data latches with asynchronous clear and gate enable. When the asynchronous clear input (CLR) is High, it overrides the other inputs and resets the data (Q) outputs Low. (Q) reflects the data (D) inputs while the gate (G) and gate enable (GE) are High, and (CLR) is Low. If (GE) is Low, data on (D) cannot be latched. The data on the (D) input during the High-to-Low gate transition is stored in the latch. The data on the (Q) output remains unchanged as long as (G) or (GE) remains Low.

This latch is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs
CLR	**GE**	**G**	**Dn**	**Qn**
1	X	X	X	0
0	0	X	X	No Change
0	1	1	Dn	Dn
0	1	0	X	No Change
0	1	↓	Dn	Dn

Design Entry Method

This design element is only for use in schematics.

Available Attributes

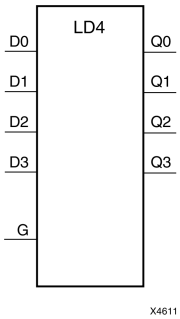
Attribute	Type	Allowed Values	Default	Description
INIT	Binary	Any 16-Bit Value	All zeros	Sets the initial value of Q output after configuration

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

LD4

Macro: Multiple Transparent Data Latch



Introduction

This design element has four transparent data latches with a common gate enable (G). The data output (Q) of the latch reflects the data (D) input while the gate enable (G) input is High. The data on the (D) input during the High-to-Low gate transition is stored in the latch. The data on the (Q) output remains unchanged as long as (G) remains Low.

This latch is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
G	**D**	**Q**
1	Dn	Dn
0	X	No Change
↓	Dn	Dn

Design Entry Method

This design element is only for use in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description

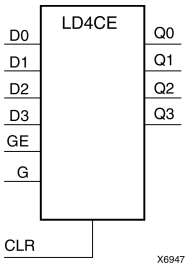
LD4CE

Macro: Transparent Data Latch with Asynchronous Clear and Gate Enable



Introduction

This design element has 4 transparent data latches with asynchronous clear and gate enable. When the asynchronous clear input (CLR) is High, it overrides the other inputs and resets the data (Q) outputs Low. (Q) reflects the data (D) inputs while the gate (G) and gate enable (GE) are High, and (CLR) is Low. If (GE) is Low, data on (D) cannot be latched. The data on the (D) input during the High-to-Low gate transition is stored in the latch. The data on the (Q) output remains unchanged as long as (G) or (GE) remains Low.

This latch is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

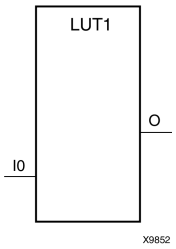
LUT1

Primitive: 1-Bit Look-Up Table with General Output



Introduction

This design element is a 1-bit look-up table (LUT) with general output (O).

An INIT attribute with an appropriate number of hexadecimal digits for the number of inputs must be attached to the LUT to specify its function. This element provides a look-up table version of a buffer or inverter. These elements are the basic building blocks. Two LUTs are available in each CLB slice; four LUTs are available in each CLB. Multiple variants of LUTs accommodate additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

Inputs	Outputs
I0	**O**
0	INIT[0]
1	INIT[1]
INIT = Binary number assigned to the INIT attribute	

Design Entry Method

This design element can be used in schematics.

Available Attributes

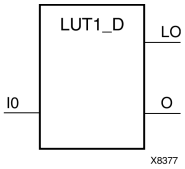
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 2-Bit Value	All zeros	Initializes look-up tables.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

LUT1_D

Primitive: 1-Bit Look-Up Table with Dual Output



Introduction

This design element is a 1-bit look-up table (LUT) with two functionally identical outputs, O and LO. It provides a look-up table version of a buffer or inverter.

The O output is a general interconnect. The LO output is used to connect to another output within the same CLB slice and to the fast connect buffer. A mandatory INIT attribute, with an appropriate number of hexadecimal digits for the number of inputs, must be attached to the LUT to specify its function.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

Inputs	Outputs	
I0	**O**	**LO**
0	INIT[0]	INIT[0]
1	INIT[1]	INIT[1]

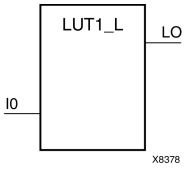
LUT1_L

Primitive: 1-Bit Look-Up Table with Local Output



Introduction

This design element is a 1-bit look-up table (LUT) with a local output (LO) that is used to connect to another output within the same CLB slice and to the fast connect buffer. It provides a look-up table version of a buffer or inverter.

A mandatory INIT attribute, with an appropriate number of hexadecimal digits for the number of inputs, must be attached to the LUT to specify its function.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

Inputs	Outputs
I0	**LO**
0	INIT[0]
1	INIT[1]
INIT = Binary number assigned to the INIT attribute	

Design Entry Method

This design element can be used in schematics.

Available Attributes

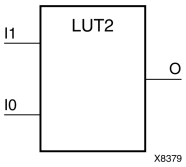
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 2-Bit Value	All zeros	Initializes look-up tables.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

LUT2

Primitive: 2-Bit Look-Up Table with General Output



Introduction

This design element is a 2-bit look-up table (LUT) with general output (O).

An INIT attribute with an appropriate number of hexadecimal digits for the number of inputs must be attached to the LUT to specify its function. This element provides a look-up table version of a buffer or inverter. These elements are the basic building blocks. Two LUTs are available in each CLB slice; four LUTs are available in each CLB. Multiple variants of LUTs accommodate additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

Inputs		Outputs
I1	**I0**	**O**
0	0	INIT[0]
0	1	INIT[1]
1	0	INIT[2]
1	1	INIT[3]
INIT = Binary equivalent of the hexadecimal number assigned to the INIT attribute		

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 4-Bit Value	All zeros	Initializes look-up tables.

For More Information

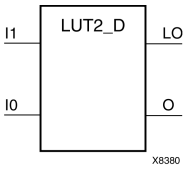
- See the *Spartan-3A FPGA Family Data Sheet*.

LUT2_D

Primitive: 2-Bit Look-Up Table with Dual Output



Introduction

This design element is a 2-bit look-up table (LUT) with two functionally identical outputs, O and LO.

The O output is a general interconnect. The LO output is used to connect to another output within the same CLB slice and to the fast connect buffer. A mandatory INIT attribute, with an appropriate number of hexadecimal digits for the number of inputs, must be attached to the LUT to specify its function.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The LogicTable Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

Inputs		Outputs	
I1	**I0**	**O**	**LO**
0	0	INIT[0]	INIT[0]
0	1	INIT[1]	INIT[1]
1	0	INIT[2]	INIT[2]
1	1	INIT[3]	INIT[3]
INIT = Binary equivalent of the hexadecimal number assigned to the INIT attribute			

Design Entry Method

This design element can be used in schematics.

Available Attributes

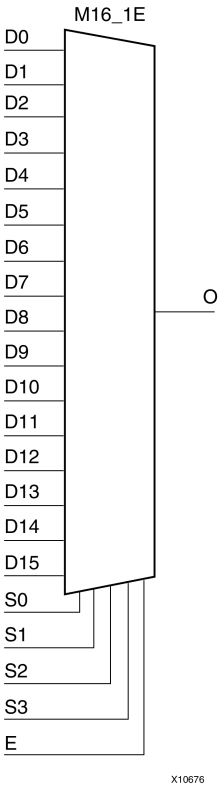
M16_1E

Macro: 16-to-1 Multiplexer with Enable



Introduction

This design element is a 16-to-1 multiplexer with enable. When the enable input (E) is High, the M16_1E multiplexer chooses one data bit from 16 sources (D15 : D0) under the control of the select inputs (S3 : S0). The output (O) reflects the state of the selected input as shown in the logic table. When (E) is Low, the output is Low.

Logic Table

Inputs						Outputs
E	**S3**	**S2**	**S1**	**S0**	**D15-D0**	**O**
0	X	X	X	X	X	0
1	0	0	0	0	D0	D0
1	0	0	0	1	D1	D1
1	0	0	1	0	D2	D2
1	0	0	1	1	D3	D3
. . .	. . .	. . .	. . .	. . .	. . .	. . .
1	1	1	0	0	D12	D12
1	1	1	0	1	D13	D13
1	1	1	1	0	D14	D14
1	1	1	1	1	D15	D15

Design Entry Method

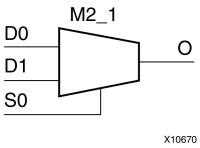
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

M2_1

Macro: 2-to-1 Multiplexer



Introduction

This design element chooses one data bit from two sources (D1 or D0) under the control of the select input (S0). The output (O) reflects the state of the selected data input. When Low, S0 selects D0 and when High, S0 selects D1.

Logic Table

Inputs			Outputs
S0	**D1**	**D0**	**O**
1	D1	X	D1
0	X	D0	D0

Design Entry Method

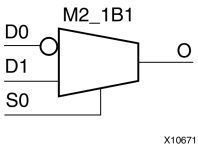
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

M2_1B1

Macro: 2-to-1 Multiplexer with D0 Inverted



Introduction

This design element chooses one data bit from two sources (D1 or D0) under the control of select input (S0). When S0 is Low, the output (O) reflects the inverted value of (D0). When S0 is High, (O) reflects the state of D1.

Logic Table

Inputs			Outputs
S0	**D1**	**D0**	**O**
1	1	X	1
1	0	X	0
0	X	1	0
0	X	0	1

Design Entry Method

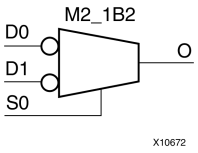
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

M2_1B2

Macro: 2-to-1 Multiplexer with D0 and D1 Inverted



Introduction

This design element chooses one data bit from two sources (D1 or D0) under the control of select input (S0). When S0 is Low, the output (O) reflects the inverted value of D0. When S0 is High, O reflects the inverted value of D1.

Logic Table

Inputs			Outputs
S0	**D1**	**D0**	**O**
1	1	X	0
1	0	X	1
0	X	1	0
0	X	0	1

Design Entry Method

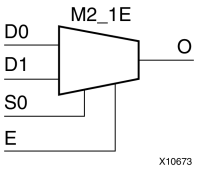
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

M2_1E

Macro: 2-to-1 Multiplexer with Enable



Introduction

This design element is a 2-to-1 multiplexer with enable. When the enable input (E) is High, the M2_1E chooses one data bit from two sources (D1 or D0) under the control of select input (S0). When Low, S0 selects D0 and when High, S0 selects D1. When (E) is Low, the output is Low.

Logic Table

Inputs				Outputs
E	**S0**	**D1**	**D0**	**O**
0	X	X	X	0
1	0	X	1	1
1	0	X	0	0
1	1	1	X	1
1	1	0	X	0

Design Entry Method

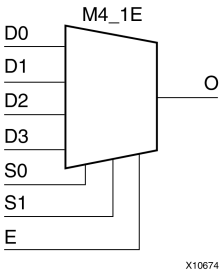
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

M4_1E

Macro: 4-to-1 Multiplexer with Enable



Introduction

This design element is a 4-to-1 multiplexer with enable. When the enable input (E) is High, the M4_1E multiplexer chooses one data bit from four sources (D3, D2, D1, or D0) under the control of the select inputs (S1 : S0). The output (O) reflects the state of the selected input as shown in the logic table. When (E) is Low, the output is Low.

Logic Table

Inputs							Outputs
E	**S1**	**S0**	**D0**	**D1**	**D2**	**D3**	**O**
0	X	X	X	X	X	X	0
1	0	0	D0	X	X	X	D0
1	0	1	X	D1	X	X	D1
1	1	0	X	X	D2	X	D2
1	1	1	X	X	X	D3	D3

Design Entry Method

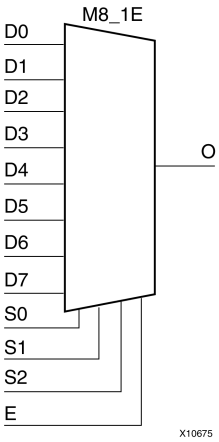
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

M8_1E

Macro: 8-to-1 Multiplexer with Enable



Introduction

This design element is an 8-to-1 multiplexer with enable. When the enable input (E) is High, the M8_1E multiplexer chooses one data bit from eight sources (D7 : D0) under the control of the select inputs (S2 : S0). The output (O) reflects the state of the selected input as shown in the logic table. When (E) is Low, the output is Low.

Logic Table

Inputs					Outputs
E	**S2**	**S1**	**S0**	**D7-D0**	**O**
0	X	X	X	X	0
1	0	0	0	D0	D0
1	0	0	1	D1	D1
1	0	1	0	D2	D2
1	0	1	1	D3	D3
1	1	0	0	D4	D4
1	1	0	1	D5	D5
1	1	1	0	D6	D6
1	1	1	1	D7	D7

Design Entry Method

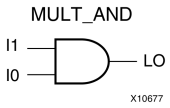
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MULT_AND

Primitive: Fast Multiplier AND



Introduction

The design element is an AND component located within the slice where the two inputs are shared with the 4-input LUT and the output drives into the carry logic. This added logic is especially useful for building fast and smaller multipliers. However, it can be used for other purposes as well. The I1 and I0 inputs must be connected to the I1 and I0 inputs of the associated LUT. The LO output must be connected to the DI input of the associated MUXCY, MUXCY_D, or MUXCY_L.

Logic Table

Inputs		Outputs
I1	**I0**	**LO**
0	0	0
0	1	0
1	0	0
1	1	1

Design Entry Method

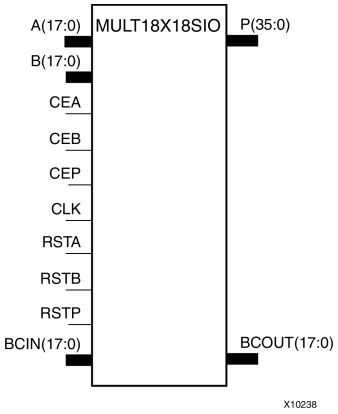
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MULT18X18SIO

Primitive: 18 x 18 Cascadable Signed Multiplier with Optional Input and Output Registers, Clock Enable, and Synchronous Reset



Introduction

This design element is a 36-bit output, 18x18-bit input dedicated signed multiplier. This component can perform asynchronous multiplication operations when the attributes AREG, BREG and PREG are all set to 0. Alternatively, synchronous multiplication operations of different latency and performance characteristics can be performed when any combination of those attributes is set to 1. When using the multiplier in synchronous operation, the MULT18X18SIO features active high clock enables for each set of register banks in the multiplier, CEA, CEB and CEP, as well as synchronous resets, RSTA, RSTB, and RSTP. Multiple MULT18X18SIOs can be cascaded to create larger multiplication functions using the BCIN and BCOUT ports in combination with the B_INPUT attribute.

Design Entry Method

This design element can be used in schematics.

Available Attributes

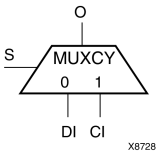
Attribute	Type	Allowed Values	Default	Descriptions
AREG	Integer	0, 1	1	Specifies the use of the input registers on the A port. A zero disables the use of the register; a one enables the register.
BREG	Integer	0, 1	1	Specifies the use of the input registers on the B port. A zero disables the use of the register; a one enables the register.
B_INPUT	String	"DIRECT" or "CASCADE"	"DIRECT"	Specifies whether the B port is connected to the general FPGA fabric, “DIRECT” or is connected to the BCOUT port of another MULT18X18SIO.
PREG	Integer	0, 1	1	Specifies the use of the output registers of the multiplier. A zero disables the use of the register; a one enables the register.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXCY

Primitive: 2-to-1 Multiplexer for Carry Logic with General Output



Introduction

The direct input (DI) of a slice is connected to the (DI) input of the MUXCY. The carry in (CI) input of an LC is connected to the CI input of the MUXCY. The select input (S) of the MUXCY is driven by the output of the look-up table (LUT) and configured as a MUX function. The carry out (O) of the MUXCY reflects the state of the selected input and implements the carry out function of each LC. When Low, S selects DI; when High, S selects CI.

The variants “MUXCY_D” and “MUXCY_L” provide additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

Logic Table

Inputs			Outputs
S	**DI**	**CI**	**O**
0	1	X	1
0	0	X	0
1	X	1	1
1	X	0	0

Design Entry Method

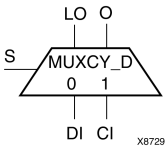
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXCY_D

Primitive: 2-to-1 Multiplexer for Carry Logic with Dual Output



Introduction

This design element implements a 1-bit, high-speed carry propagate function. One such function can be implemented per logic cell (LC), for a total of 4-bits per configurable logic block (CLB). The direct input (DI) of an LC is connected to the DI input of the MUXCY_D. The carry in (CI) input of an LC is connected to the CI input of the MUXCY_D. The select input (S) of the MUX is driven by the output of the look-up table (LUT) and configured as an XOR function. The carry out (O and LO) of the MUXCY_D reflects the state of the selected input and implements the carry out function of each LC. When Low, S selects DI; when High, S selects CI.

Outputs O and LO are functionally identical. The O output is a general interconnect. See also "MUXCY" and "MUXCY_L".

Logic Table

Inputs			Outputs	
S	**DI**	**CI**	**O**	**LO**
0	1	X	1	1
0	0	X	0	0
1	X	1	1	1
1	X	0	0	0

Design Entry Method

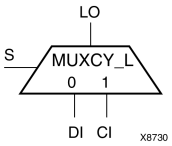
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXCY_L

Primitive: 2-to-1 Multiplexer for Carry Logic with Local Output



Introduction

This design element implements a 1-bit high-speed carry propagate function. One such function is implemented per logic cell (LC), for a total of 4-bits per configurable logic block (CLB). The direct input (DI) of an LC is connected to the DI input of the MUXCY_L. The carry in (CI) input of an LC is connected to the CI input of the MUXCY_L. The select input (S) of the MUXCY_L is driven by the output of the look-up table (LUT) and configured as an XOR function. The carry out (LO) of the MUXCY_L reflects the state of the selected input and implements the carry out function of each (LC). When Low, (S) selects DI; when High, (S) selects (CI).

See also "MUXCY" and "MUXCY_D."

Logic Table

Inputs			Outputs
S	**DI**	**CI**	**LO**
0	1	X	1
0	0	X	0
1	X	1	1
1	X	0	0

Design Entry Method

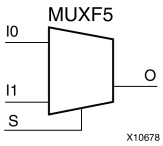
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF5

Primitive: 2-to-1 Look-Up Table Multiplexer with General Output



Introduction

This design element provides a multiplexer function in a CLB slice for creating a function-of-5 look-up table or a 4-to-1 multiplexer in combination with the associated look-up tables. The local outputs (LO) from the two look-up tables are connected to the I0 and I1 inputs of the MUXF5. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The variants, “MUXF5_D” and “MUXF5_L”, provide additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

Logic Table

Inputs			Outputs
S	**I0**	**I1**	**O**
0	1	X	1
0	0	X	0
1	X	1	1
1	X	0	0

Design Entry Method

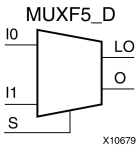
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF5_D

Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output



Introduction

This design element provides a multiplexer function in a CLB slice for creating a function-of-5 look-up table or a 4-to-1 multiplexer in combination with the associated look-up tables. The local outputs (LO) from the two look-up tables are connected to the I0 and I1 inputs of the MUXF5. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

Outputs O and LO are functionally identical. The O output is a general interconnect. The LO output connects to other inputs in the same CLB slice. See also “MUXF5” and “MUXF5_L”.

Logic Table

Inputs			Outputs	
S	**I0**	**I1**	**O**	**LO**
0	1	X	1	1
0	0	X	0	0
1	X	1	1	1
1	X	0	0	0

Design Entry Method

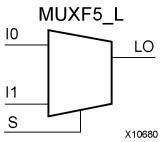
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF5_L

Primitive: 2-to-1 Look-Up Table Multiplexer with Local Output



Introduction

This design element provides a multiplexer function in a CLB slice for creating a function-of-5 look-up table or a 4-to-1 multiplexer in combination with the associated look-up tables. The local outputs (LO) from the two look-up tables are connected to the I0 and I1 inputs of the MUXF5. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The LO output connects to other inputs in the same CLB slice.

See also "MUXF5" and "MUXF5_D".

Logic Table

Inputs			Output
S	**I0**	**I1**	**LO**
0	1	X	1
0	0	X	0
1	X	1	1
1	X	0	0

Design Entry Method

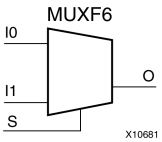
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF6

Primitive: 2-to-1 Look-Up Table Multiplexer with General Output



Introduction

This design element provides a multiplexer function in two slices for creating a function-of-6 look-up table or an 8-to-1 multiplexer in combination with the associated four look-up tables and two MUXF5s. The local outputs (LO) from the two MUXF5s in the CLB are connected to the I0 and I1 inputs of the MUXF6. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The variants, “MUXF6_D” and “MUXF6_L”, provide additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

Logic Table

Inputs			Outputs
S	**I0**	**I1**	**O**
0	1	X	1
0	0	X	0
1	X	1	1
1	X	0	0

Design Entry Method

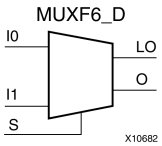
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF6_D

Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output



Introduction

This design element provides a multiplexer function in a two slices for creating a function-of-6 look-up table or an 8-to-1 multiplexer in combination with the associated four look-up tables and two MUXF5s. The local outputs (LO) from the two MUXF5s in the CLB are connected to the I0 and I1 inputs of the MUXF6. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

Outputs O and LO are functionally identical. The O output is a general interconnect. The LO output connects to other inputs in the same CLB slice.

Logic Table

Inputs			Outputs	
S	**I0**	**I1**	**O**	**LO**
0	1	X	1	1
0	0	X	0	0
1	X	1	1	1
1	X	0	0	0

Design Entry Method

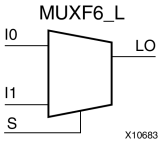
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF6_L

Primitive: 2-to-1 Look-Up Table Multiplexer with Local Output



Introduction

This design element provides a multiplexer function for use in creating a function-of-6 look-up table or an 8-to-1 multiplexer in combination with the associated four look-up tables and two MUXF5s. The local outputs (LO) from the two MUXF5s in the CLB are connected to the I0 and I1 inputs of the MUXF6. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The LO output connects to other inputs in the same CLB slice.

Logic Table

Inputs			Output
S	**I0**	**I1**	**LO**
0	1	X	1
0	0	X	0
1	X	1	1
1	X	0	0

Design Entry Method

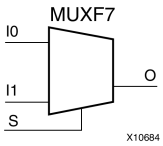
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF7

Primitive: 2-to-1 Look-Up Table Multiplexer with General Output



Introduction

This design element provides a multiplexer function for use in creating a function-of-7 look-up table or an 8-to-1 multiplexer in combination with the associated look-up tables. Local outputs (LO) of MUXF6 are connected to the I0 and I1 inputs of the MUXF7. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The variants, "MUXF7_D" and "MUXF7_L", provide additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

Logic Table

Inputs			Outputs
S	**I0**	**I1**	**O**
0	I0	X	I0
1	X	I1	I1
X	0	0	0
X	1	1	1

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Output of MUX to general routing
I0	Input	1	Input (tie to MUXF6 LO out)
I1	Input	1	Input (tie to MUXF6 LO out)
S	Input	1	Input select to MUX

Design Entry Method

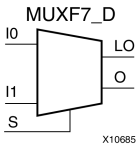
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF7_D

Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output



Introduction

This design element provides a multiplexer function for use in creating a function-of-7 look-up table or a 16-to-1 multiplexer in combination with the associated look-up tables. Local outputs (LO) of MUXF6 are connected to the I0 and I1 inputs of the MUXF7. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

Outputs O and LO are functionally identical. The O output is a general interconnect. The LO output connects to other inputs in the same CLB slice.

Logic Table

Inputs			Outputs	
S	**I0**	**I1**	**O**	**LO**
0	I0	X	I0	I0
1	X	I1	I1	I1
X	0	0	0	0
X	1	1	1	1

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Output of MUX to general routing
LO	Output	1	Output of MUX to local routing
I0	Input	1	Input (tie to MUXF6 LO out)
I1	Input	1	Input (tie to MUXF6 LO out)
S	Input	1	Input select to MUX

Design Entry Method

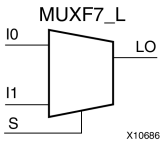
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF7_L

Primitive: 2-to-1 look-up table Multiplexer with Local Output



Introduction

This design element provides a multiplexer function for use in creating a function-of-7 look-up table or a 16-to-1 multiplexer in combination with the associated look-up tables. Local outputs (LO) of MUXF6 are connected to the I0 and I1 inputs of the MUXF7. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The LO output connects to other inputs in the same CLB slice.

Logic Table

Inputs			Output
S	**I0**	**I1**	**LO**
0	I0	X	I0
1	X	I1	I1
X	0	0	0
X	1	1	1

Port Descriptions

Port	Direction	Width	Function
LO	Output	1	Output of MUX to local routing
I0	Input	1	Input
I1	Input	1	Input
S	Input	1	Input select to MUX

Design Entry Method

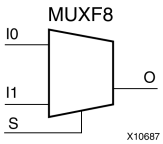
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF8

Primitive: 2-to-1 Look-Up Table Multiplexer with General Output



Introduction

This design element provides a multiplexer function in eight slices for creating a function-of-8 look-up table or a 16-to-1 multiplexer in combination with the associated look-up tables, MUXF5s, MUXF6s, and MUXF7s. Local outputs (LO) of MUXF7 are connected to the I0 and I1 inputs of the MUXF8. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

Logic Table

Inputs			Outputs
S	**I0**	**I1**	**O**
0	I0	X	I0
1	X	I1	I1
X	0	0	0
X	1	1	1

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Output of MUX to general routing
I0	Input	1	Input (tie to MUXF7 LO out)
I1	Input	1	Input (tie to MUXF7 LO out)
S	Input	1	Input select to MUX

Design Entry Method

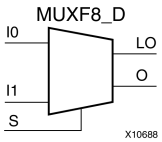
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF8_D

Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output



Introduction

This design element provides a multiplexer function in eight slices for creating a function-of-8 look-up table or a 32-to-1 multiplexer in combination with the associated four look-up tables and two MUXF8s. Local outputs (LO) of MUXF7 are connected to the I0 and I1 inputs of the MUXF8. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

Outputs O and LO are functionally identical. The O output is a general interconnect. The LO output connects to other inputs in the same CLB slice.

Logic Table

Inputs			Outputs	
S	**I0**	**I1**	**O**	**LO**
0	I0	X	I0	I0
1	X	I1	I1	I1
X	0	0	0	0
X	1	1	1	1

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Output of MUX to general routing
LO	Output	1	Output of MUX to local routing
I0	Input	1	Input (tie to MUXF7 LO out)
I1	Input	1	Input (tie to MUXF7 LO out)
S	Input	1	Input select to MUX

Design Entry Method

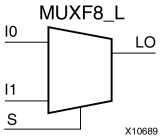
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

MUXF8_L

Primitive: 2-to-1 Look-Up Table Multiplexer with Local Output



Introduction

This design element provides a multiplexer function in eight slices for creating a function-of-8 look-up table or a 32-to-1 multiplexer in combination with the associated four look-up tables and two MUXF8s. Local outputs (LO) of MUXF7 are connected to the I0 and I1 inputs of the MUXF8. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The LO output connects to other inputs in the same CLB slice.

Logic Table

Inputs			Output
S	**I0**	**I1**	**LO**
0	I0	X	I0
1	X	I1	I1
X	0	0	0
X	1	1	1

Port Descriptions

Port	Direction	Width	Function
LO	Output	1	Output of MUX to local routing
I0	Input	1	Input (tie to MUXF7 LO out)
I1	Input	1	Input (tie to MUXF7 LO out)
S	Input	1	Input select to MUX

Design Entry Method

This design element can be used in schematics.

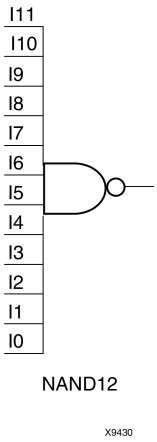
NAND12

Macro: 12- Input NAND Gate with Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

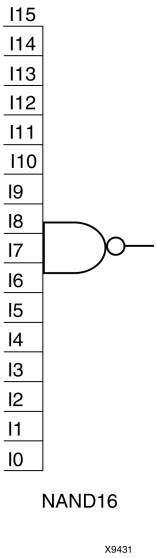
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND16

Macro: 16- Input NAND Gate with Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

This design element is only for use in schematics.

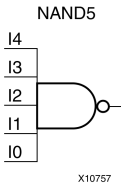
NAND5

Primitive: 5-Input NAND Gate with Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

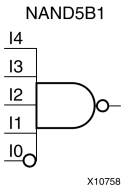
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND5B1

Primitive: 5-Input NAND Gate with 1 Inverted and 4 Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

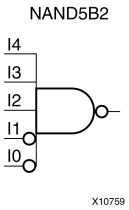
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND5B2

Primitive: 5-Input NAND Gate with 2 Inverted and 3 Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

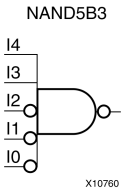
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND5B3

Primitive: 5-Input NAND Gate with 3 Inverted and 2 Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

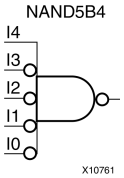
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND5B4

Primitive: 5-Input NAND Gate with 4 Inverted and 1 Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

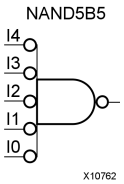
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND5B5

Primitive: 5-Input NAND Gate with Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

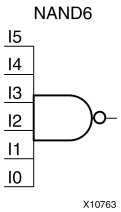
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND6

Macro: 6-Input NAND Gate with Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

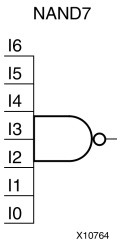
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND7

Macro: 7-Input NAND Gate with Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

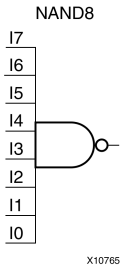
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND8

Macro: 8-Input NAND Gate with Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

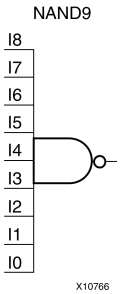
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NAND9

Macro: 9-Input NAND Gate with Non-Inverted Inputs



Introduction

NAND gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NAND gates of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

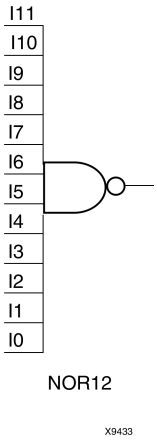
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR12

Macro: 12-Input NOR Gate with Non-Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

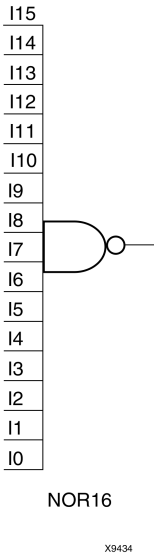
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR16

Macro: 16-Input NOR Gate with Non-Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

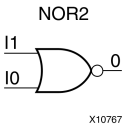
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR2

Primitive: 2-Input NOR Gate with Non-Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

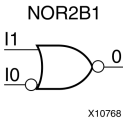
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR2B1

Primitive: 2-Input NOR Gate with 1 Inverted and 1 Non-Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

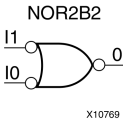
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR2B2

Primitive: 2-Input NOR Gate with Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

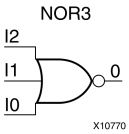
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR3

Primitive: 3-Input NOR Gate with Non-Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

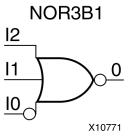
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR3B1

Primitive: 3-Input NOR Gate with 1 Inverted and 2 Non-Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

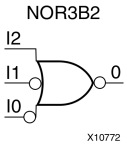
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR3B2

Primitive: 3-Input NOR Gate with 2 Inverted and 1 Non-Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

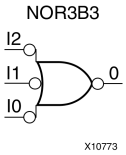
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR3B3

Primitive: 3-Input NOR Gate with Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

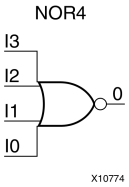
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR4

Primitive: 4-Input NOR Gate with Non-Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

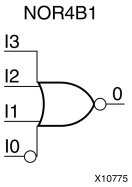
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

NOR4B1

Primitive: 4-Input NOR Gate with 1 Inverted and 3 Non-Inverted Inputs



Introduction

NOR gates of up to five inputs are available in any combination of inverting and non-inverting inputs. NOR gates of six to nine inputs, 12 inputs, and 16 inputs are available only with non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace gates with unused inputs with gates having the necessary number of inputs.

Design Entry Method

This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.

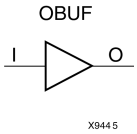
OBUF

Primitive: Output Buffer



Introduction

This design element is a simple output buffer used to drive output signals to the FPGA device pins that do not need to be 3-stated (constantly driven). Either an OBUF, OBUFT, OBUFDS, or OBUFTDS must be connected to every output port in the design.

This element isolates the internal circuit and provides drive current for signals leaving a chip. It exists in input/output blocks (IOB). Its output (O) is connected to an OPAD or an IOPAD. The interface standard used by this element is LVTTL. Also, this element has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints. The defaults are DRIVE=12 mA and SLOW slew.

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Output of OBUF to be connected directly to top-level output port.
I	Input	1	Input of OBUF. Connect to the logic driving the output port.

Design Entry Method

This design element can be used in schematics.

Available Attributes

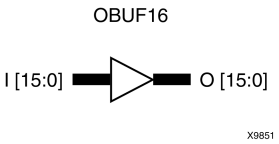
Attribute	Type	Allowed Values	Default	Description
DRIVE	Integer	2, 4, 6, 8, 12, 16, 24	12	Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.
SLEW	String	"SLOW" or "FAST"	"SLOW"	Specifies the slew rate of the output driver. Consult the product Data Sheet for recommendations of the best setting for this attribute.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OBUF16

Macro: 16-Bit Output Buffer



Introduction

This design element is a multiple output buffer.

This element isolates the internal circuit and provides drive current for signals leaving a chip. It exists in input/output blocks (IOB). Its output (O) is connected to an OPAD or an IOPAD. The interface standard used by this element is LVTTL. Also, this element has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints. The defaults are DRIVE=12 mA and SLOW slew.

Design Entry Method

This design element can be used in schematics.

Available Attributes

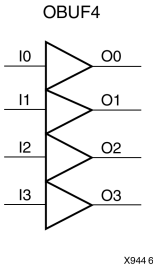
Attribute	Type	Allowed Values	Default	Description
DRIVE	Integer	2, 4, 6, 8, 12, 16, 24	12	Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.
SLEW	String	"SLOW" or "FAST"	"SLOW"	Specifies the slew rate of the output driver. Consult the product Data Sheet for recommendations of the best setting for this attribute.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OBUF4

Macro: 4-Bit Output Buffer



Introduction

This design element is a multiple output buffer.

This element isolates the internal circuit and provides drive current for signals leaving a chip. It exists in input/output blocks (IOB). Its output (O) is connected to an OPAD or an IOPAD. The interface standard used by this element is LVTTL. Also, this element has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints. The defaults are DRIVE=12 mA and SLOW slew.

Design Entry Method

This design element can be used in schematics.

Available Attributes

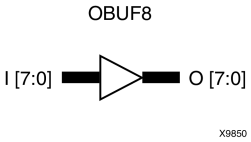
Attribute	Type	Allowed Values	Default	Description
DRIVE	Integer	2, 4, 6, 8, 12, 16, 24	12	Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.
SLEW	String	"SLOW" or "FAST"	"SLOW"	Specifies the slew rate of the output driver. Consult the product Data Sheet for recommendations of the best setting for this attribute.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OBUF8

Macro: 8-Bit Output Buffer



Introduction

This design element is a multiple output buffer.

This element isolates the internal circuit and provides drive current for signals leaving a chip. It exists in input/output blocks (IOB). Its output (O) is connected to an OPAD or an IOPAD. The interface standard used by this element is LVTTL. Also, this element has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints. The defaults are DRIVE=12 mA and SLOW slew.

Design Entry Method

This design element can be used in schematics.

Available Attributes

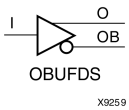
Attribute	Type	Allowed Values	Default	Description
DRIVE	Integer	2, 4, 6, 8, 12, 16, 24	12	Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.
SLEW	String	"SLOW" or "FAST"	"SLOW"	Specifies the slew rate of the output driver. Consult the product Data Sheet for recommendations of the best setting for this attribute.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OBUFDS

Primitive: Differential Signaling Output Buffer



Introduction

This design element is a single output buffer that supports low-voltage, differential signaling (1.8 v CMOS). OBUFDS isolates the internal circuit and provides drive current for signals leaving the chip. Its output is represented as two distinct ports (O and OB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET and MYNETB).

Logic Table

Inputs	Outputs	
I	**O**	**OB**
0	0	1
1	1	0

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Diff_p output (connect directly to top level port)
OB	Output	1	Diff_n output (connect directly to top level port)
I	Input	1	Buffer input

Design Entry Method

This design element can be used in schematics.

Available Attributes

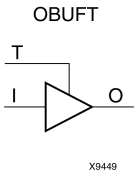
Attribute	Type	Allowed Values	Default	Description
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OBUFT

Primitive: 3-State Output Buffer with Active Low Output Enable



Introduction

This design element is a single, 3-state output buffer with input I, output O, and active-Low output enables (T). This element uses the LVTTL standard and has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints. The defaults are DRIVE=12 mA and SLOW slew.

When T is Low, data on the inputs of the buffers is transferred to the corresponding outputs. When T is High, the output is high impedance (off or Z state). OBUFTs are generally used when a single-ended output is needed with a 3-state capability, such as the case when building bidirectional I/O.

Logic Table

Inputs		Outputs
T	**I**	**O**
1	X	Z
0	1	1
0	0	0

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Buffer output (connect directly to top-level port)
I	Input	1	Buffer input
T	Input	1	3-state enable input

Design Entry Method

This design element can be used in schematics.

Available Attributes

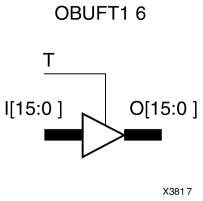
Attribute	Type	Allowed Values	Default	Description
DRIVE	Integer	2, 4, 6, 8, 12, 16, 24	12	Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.
SLEW	String	"SLOW" or "FAST"	"SLOW"	Specifies the slew rate of the output driver. See the Data Sheet for recommendations of the best setting for this attribute.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OBUFT16

Macro: 16-Bit 3-State Output Buffer with Active Low Output Enable



Introduction

This design element is a multiple, 3-state output buffer with input I, output O, and active-Low output enables (T). This element uses the LVTTL standard and has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints. The defaults are DRIVE=12 mA and SLOW slew.

When T is Low, data on the inputs of the buffers is transferred to the corresponding outputs. When T is High, the output is high impedance (off or Z state). OBUFTs are generally used when a single-ended output is needed with a 3-state capability, such as the case when building bidirectional I/O.

Logic Table

Inputs		Outputs
T	**I**	**O**
1	X	Z
0	1	1
0	0	0

Design Entry Method

This design element is only for use in schematics.

Available Attributes

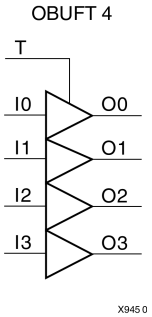
Attribute	Type	Allowed Values	Default	Description
DRIVE	Integer	2, 4, 6, 8, 12, 16, 24	12	Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.
SLEW	String	"SLOW" or "FAST"	"SLOW"	Specifies the slew rate of the output driver. See the Data Sheet for recommendations of the best setting for this attribute.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OBUFT4

Macro: 4-Bit 3-State Output Buffers with Active-Low Output Enable



Introduction

This design element is a multiple, 3-state output buffer with input I, output O, and active-Low output enables (T). This element uses the LVTTL standard and has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints. The defaults are DRIVE=12 mA and SLOW slew.

When T is Low, data on the inputs of the buffers is transferred to the corresponding outputs. When T is High, the output is high impedance (off or Z state). OBUFTs are generally used when a single-ended output is needed with a 3-state capability, such as the case when building bidirectional I/O.

Logic Table

Inputs		Outputs
T	**I**	**O**
1	X	Z
0	1	1
0	0	0

Design Entry Method

This design element is only for use in schematics.

Available Attributes

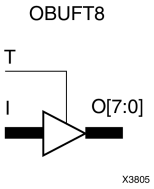
Attribute	Type	Allowed Values	Default	Description
DRIVE	Integer	2, 4, 6, 8, 12, 16, 24	12	Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.
SLEW	String	"SLOW" or "FAST"	"SLOW"	Specifies the slew rate of the output driver. See the Data Sheet for recommendations of the best setting for this attribute.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OBUFT8

Macro: 8-Bit 3-State Output Buffers with Active-Low Output Enable



Introduction

This design element is a multiple, 3-state output buffer with input I, output O, and active-Low output enables (T). This element uses the LVTTL standard and has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints. The defaults are DRIVE=12 mA and SLOW slew.

When T is Low, data on the inputs of the buffers is transferred to the corresponding outputs. When T is High, the output is high impedance (off or Z state). OBUFTs are generally used when a single-ended output is needed with a 3-state capability, such as the case when building bidirectional I/O.

Logic Table

Inputs		Outputs
T	**I**	**O**
1	X	Z
0	1	1
0	0	0

Design Entry Method

This design element is only for use in schematics.

Available Attributes

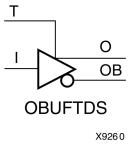
Attribute	Type	Allowed Values	Default	Description
DRIVE	Integer	2, 4, 6, 8, 12, 16, 24	12	Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements.
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.
SLEW	String	"SLOW" or "FAST"	"SLOW"	Specifies the slew rate of the output driver. See the Data Sheet for recommendations of the best setting for this attribute.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OBUFTDS

Primitive: 3-State Output Buffer with Differential Signaling, Active-Low Output Enable



Introduction

This design element is an output buffer that supports low-voltage, differential signaling. For the OBUFTDS, a design level interface signal is represented as two distinct ports (O and OB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N).

Logic Table

Inputs		Outputs	
I	**T**	**O**	**OB**
X	1	Z	Z
0	0	0	1
1	0	1	0

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Diff_p output (connect directly to top level port)
OB	Output	1	Diff_n output (connect directly to top level port)
I	Input	1	Buffer input
T	Input	1	3-state enable input

Design Entry Method

This design element can be used in schematics.

Available Attributes

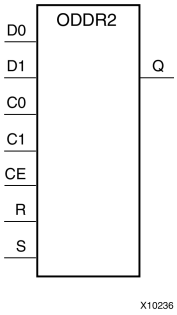
Attribute	Type	Allowed Values	Default	Description
IOSTANDARD	String	See Data Sheet	"DEFAULT"	Assigns an I/O standard to the element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ODDR2

Primitive: Dual Data Rate Output D Flip-Flop with Optional Data Alignment, Clock Enable and Programmable Synchronous or Asynchronous Set/Reset



Introduction

The design element is an output double data rate (DDR) register useful in producing double data rate signals exiting the FPGA. The ODDR2 requires two clocks (C0 and C1) to be connected to the component so that data is provided at the positive edge of both clocks. The ODDR2 features an active high clock enable port, CE, which can be used to suspend the operation of the registers and both set and reset ports that can be configured to be synchronous or asynchronous to the respective clocks. The ODDR2 has an optional alignment feature, which allows data to be captured by a single clock and clocked out by two clocks.

Logic Table

Inputs							Outputs
S	**R**	**CE**	**D0**	**D1**	**C0**	**C1**	**O**
1	X	X	X	X	X	X	1
0	1	X	X	X	X	X	not INIT
0	0	0	X	X	X	X	No Change
0	0	1	D0	X	↑	X	D0
0	0	1	X	D1	X	↑	D1
Set/Reset can be synchronous via SRTYPE value							

Design Entry Method

This design element can be used in schematics.

Available Attributes

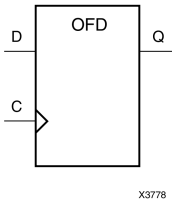
Attribute	Type	Allowed Values	Default	Descriptions
DDR_ALIGNMENT	String	"NONE", "C0", "C1"	"NONE"	Sets the input capture behavior for the DDR register. "NONE" clocks in data to the D0 input on the positive transition of the C0 clock and D1 on the positive transition of the C1 clock. "C0" allows the input clocking of both D0 and D1 align to the positive edge of the C0 clock. "C1" allows the input clocking of both D0 and D1 align to the positive edge of the C1 clock.
INIT	Integer	0, 1	0	Sets initial state of the Q0 output to 0 or 1.
SRTYPE	String	"SYNC", "ASYNC"	"SYNC"	Specifies "SYNC" or "ASYNC" set/reset.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OFD

Macro: Output D Flip-Flop



Introduction

This design element is a single output D flip-flop.

The outputs are connected to OPADs or IOPADs. The data on the (D) inputs is loaded into the flip-flops during the Low-to-High clock (C) transition and appears on the (Q) outputs.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
D	**C**	**Q**
D	↑	D

Design Entry Method

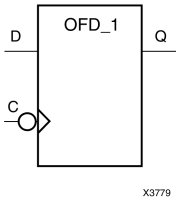
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OFD_1

Macro: Output D Flip-Flop with Inverted Clock



Introduction

The design element is located in an input/output block (IOB). The output (Q) of the D flip-flop is connected to an OPAD or an IOPAD. The data on the (D) input is loaded into the flip-flop during the High-to-Low clock (C) transition and appears on the (Q) output.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
D	**C**	**Q**
D	↓	D

Design Entry Method

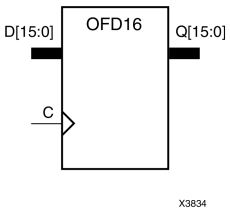
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OFD16

Macro: 16-Bit Output D Flip-Flop



Introduction

This design element is a multiple output D flip-flop.

The outputs are connected to OPADs or IOPADs. The data on the (D) inputs is loaded into the flip-flops during the Low-to-High clock (C) transition and appears on the (Q) outputs.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
D	**C**	**Q**
D	↑	D

Design Entry Method

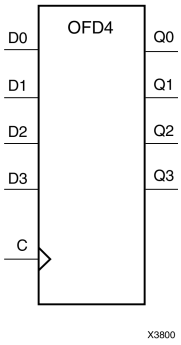
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OFD4

Macro: 4-Bit Output D Flip-Flop



Introduction

This design element is a multiple output D flip-flop.

The outputs are connected to OPADs or IOPADs. The data on the (D) inputs is loaded into the flip-flops during the Low-to-High clock (C) transition and appears on the (Q) outputs.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs		Outputs
D	**C**	**Q**
D	↑	D

Design Entry Method

This design element is only for use in schematics.

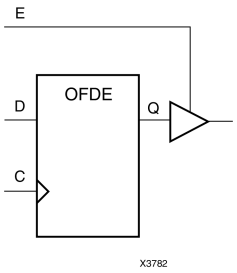
OFDE

Macro: D Flip-Flop with Active-High Enable Output Buffers



Introduction

This is a single D flip-flop whose output is enabled by a 3-state buffer. The flip-flop data output (Q) is connected to the input of output buffer (OBUFE). The OBUFE output (O) is connected to an OPAD or IOPAD. The data on the data input (D) is loaded into the flip-flop during the Low-to-High clock (C) transition. When the active-High enable input (E) is High, the data on the flip-flop output (Q) appears on the OBUFE (O) output. When (E) is Low, the output is high impedance (Z state or Off).

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Output
E	**D**	**C**	**O**
0	X	X	Z
1	Dn	↑	Dn

Design Entry Method

This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.

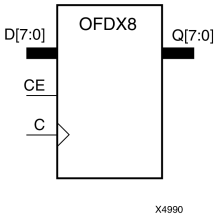
OFDX8

Macro: 8-Bit Output D Flip-Flop with Clock Enable



Introduction

This design element is a multiple output D flip-flop. The (Q) output is connected to OPAD or IOPAD. The data on the (D) input is loaded into the flip-flop during the Low-to-High clock (C) transition and appears on the (Q) output. When (CE) is Low, the flip-flop output does not change.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
CE	**D**	**C**	**Q**
1	Dn	↑	Dn
0	X	X	No change

Design Entry Method

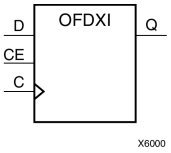
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OFDXI

Macro: Output D Flip-Flop with Clock Enable (Asynchronous Preset)



Introduction

The design element is contained in an input/output block (IOB). The output (Q) of the D flip-flop is connected to an OPAD or an IOPAD. The data on the (D) input is loaded into the flip-flop during the Low-to-High clock (C) transition and appears at the output (Q). When(CE) is Low, the output does not change

This flip-flop is asynchronously preset, output High, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
CE	**D**	**C**	**Q**
1	D	↑	D
0	X	X	No Change

Design Entry Method

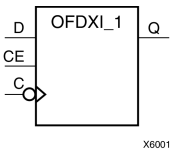
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OFDXI_1

Macro: Output D Flip-Flop with Inverted Clock and Clock Enable (Asynchronous Preset)



Introduction

The design element is located in an input/output block (IOB). The D flip-flop output (Q) is connected to an OPAD or an IOPAD. The data on the D input is loaded into the flip-flop during the High-to-Low clock (C) transition and appears on the Q output. When CE is Low, the output (Q) does not change.

This flip-flop is asynchronously preset, output High, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs			Outputs
CE	**D**	**C**	**Q**
1	D	↓	D
0	X	X	No Change

Design Entry Method

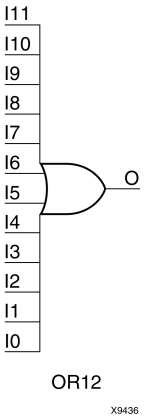
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR12

Macro: 12-Input OR Gate with Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

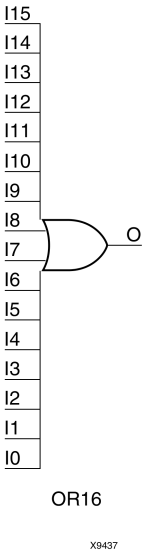
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR16

Macro: 16-Input OR Gate with Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

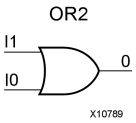
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR2

Primitive: 2-Input OR Gate with Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

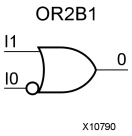
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR2B1

Primitive: 2-Input OR Gate with 1 Inverted and 1 Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

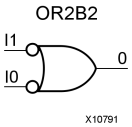
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR2B2

Primitive: 2-Input OR Gate with Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

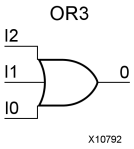
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR3

Primitive: 3-Input OR Gate with Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

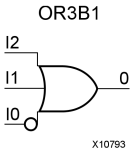
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR3B1

Primitive: 3-Input OR Gate with 1 Inverted and 2 Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

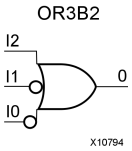
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR3B2

Primitive: 3-Input OR Gate with 2 Inverted and 1 Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

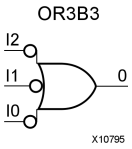
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR3B3

Primitive: 3-Input OR Gate with Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

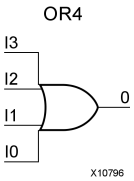
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR4

Primitive: 4-Input OR Gate with Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

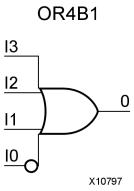
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR4B1

Primitive: 4-Input OR Gate with 1 Inverted and 3 Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

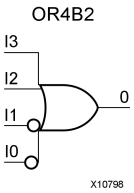
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

OR4B2

Primitive: 4-Input OR Gate with 2 Inverted and 2 Non-Inverted Inputs



Introduction

OR functions of up to five inputs are available in any combination of inverting and non-inverting inputs. OR functions of six to nine inputs, 12 inputs, and 16 inputs are available with only non-inverting inputs. To invert some or all inputs, use external inverters. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Design Entry Method

This design element is only for use in schematics.

For More Information

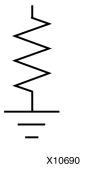
PULLDOWN

Primitive: Resistor to GND for Input Pads, Open-Drain, and 3-State Outputs

PULLDOWN



Introduction

This resistor element is connected to input, output, or bidirectional pads to guarantee a logic Low level for nodes that might float.

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Pulldown output (connect directly to top level port)

Design Entry Method

This design element can be used in schematics.

This element can be connected to a net in the following locations on a top-level schematic file:

- A net connected to an input IO Marker.
- A net connected to both an output IO Marker and 3-statable IO element, such as an OBUFT.

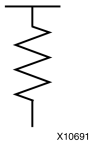
For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

PULLUP

Primitive: Resistor to VCC for Input PADs, Open-Drain, and 3-State Outputs

PULLUP



Introduction

This design element allows for an input, 3-state output or bi-directional port to be driven to a weak high value when not being driven by an internal or external source. This element establishes a High logic level for open-drain elements and macros when all the drivers are off.

Port Descriptions

Port	Direction	Width	Function
O	Output	1	Pullup output (connect directly to top level port)

Design Entry Method

This design element can be used in schematics.

This element can be connected to a net in the following locations on a top-level schematic file:

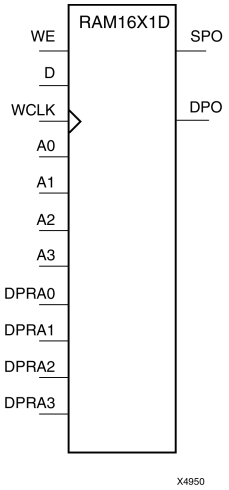
- A net connected to an input IO Marker
- A net connected to both an output IO Marker and 3-statable IO element, such as an OBUFT.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM16X1D

Primitive: 16-Deep by 1-Wide Static Dual Port Synchronous RAM



Introduction

This element is a 16-word by 1-bit static dual port random access memory with synchronous write capability. The device has two address ports: the read address (DPRA3:DPRA0) and the write address (A3:A0). These two address ports are asynchronous. The read address controls the location of the data driven out of the output pin (DPO), and the write address controls the destination of a valid write transaction. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected.

When WE is High, any positive transition on (WCLK) loads the data on the data input (D) into the word selected by the 4-bit write address. For predictable performance, write address and data inputs must be stable before a Low-to-High (WCLK) transition. This RAM block assumes an active-High (WCLK). (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block.

The SPO output reflects the data in the memory cell addressed by A3:A0. The DPO output reflects the data in the memory cell addressed by DPRA3:DPRA0.

Note The write process is not affected by the address on the read address port.

You can use the INIT attribute to directly specify an initial value. The value must be a hexadecimal number, for example, INIT=ABAC. If the INIT attribute is not specified, the RAM is initialized with all zeros.

Logic Table

Mode selection is shown in the following logic table:

Inputs			**Outputs**	
WE (mode)	**WCLK**	**D**	**SPO**	**DPO**
0 (read)	X	X	data_a	data_d
1 (read)	0	X	data_a	data_d
1 (read)	1	X	data_a	data_d
1 (write)	↑	D	D	data_d
1 (read)	↓	X	data_a	data_d
data_a = word addressed by bits A3-A0 data_d = word addressed by bits DPRA3-DPRA0				

Design Entry Method

This design element can be used in schematics.

Available Attributes

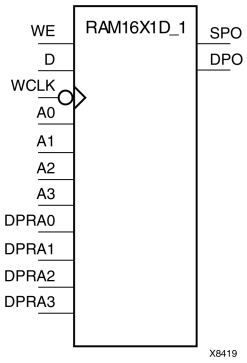
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 16-Bit Value	All zeros.	Initializes RAMs, registers, and look-up tables.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM16X1D_1

Primitive: 16-Deep by 1-Wide Static Dual Port Synchronous RAM with Negative-Edge Clock



Introduction

This is a 16-word by 1-bit static dual port random access memory with synchronous write capability and negative-edge clock. The device has two separate address ports: the read address (DPRA3:DPRA0) and the write address (A3:A0). These two address ports are asynchronous. The read address controls the location of the data driven out of the output pin (DPO), and the write address controls the destination of a valid write transaction.

When the write enable (WE) is set to Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When (WE) is High, any negative transition on (WCLK) loads the data on the data input (D) into the word selected by the 4-bit write address. For predictable performance, write address and data inputs must be stable before a High-to-Low WCLK transition. This RAM block assumes an active-High (WCLK). (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block.

You can initialize RAM16X1D_1 during configuration using the INIT attribute.

The SPO output reflects the data in the memory cell addressed by A3:A0. The DPO output reflects the data in the memory cell addressed by DPRA3:DPRA0.

Note The write process is not affected by the address on the read address port.

Logic Table

Mode selection is shown in the following logic table:

Inputs			**Outputs**	
WE (mode)	**WCLK**	**D**	**SPO**	**DPO**
0 (read)	X	X	data_a	data_d
1 (read)	0	X	data_a	data_d
1 (read)	1	X	data_a	data_d
1 (write)	↓	D	D	data_d
1 (read)	↑	X	data_a	data_d
data_a = word addressed by bits A3:A0 data_d = word addressed by bits DPRA3:DPRA0				

Port Descriptions

Port	Direction	Width	Function
DPO	Output	1	Read-only 1-Bit data output
SPO	Output	1	R/W 1-Bit data output
A0	Input	1	R/W address[0] input
A1	Input	1	R/W address[1] input
A2	Input	1	R/W address[2] input
A3	Input	1	R/W address[3] input
D	Input	1	Write 1-Bit data input
DPRA0	Input	1	Read-only address[0] input
DPRA1	Input	1	Read-only address[1] input
DPRA2	Input	1	Read-only address[2] input
DPRA3	Input	1	Read-only address[3] input
WCLK	Input	1	Write clock input
WE	Input	1	Write enable input

Design Entry Method

This design element can be used in schematics.

Available Attributes

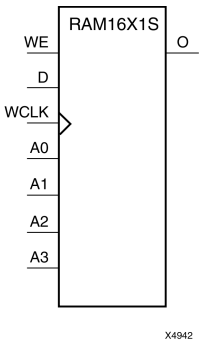
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 16-Bit Value	All zeros	Initializes RAMs, registers, and look-up tables.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM16X1S

Primitive: 16-Deep by 1-Wide Static Synchronous RAM



Introduction

This element is a 16-word by 1-bit static random access memory with synchronous write capability. When the write enable (WE) is set Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is set High, any positive transition on WCLK loads the data on the data input (D) into the word selected by the 4-bit address (A3:A0). This RAM block assumes an active-High WCLK. However, WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The signal output on the data output pin (O) is the data that is stored in the RAM at the location defined by the values on the address pins. You can initialize RAM16X1S during configuration using the INIT attribute.

Logic Table

Inputs			Outputs
WE(mode)	**WCLK**	**D**	**O**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↑	D	D
1 (read)	↓	X	Data
Data = word addressed by bits A3:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

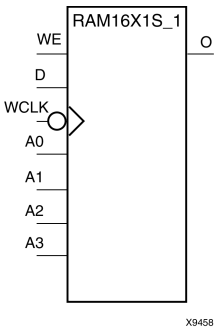
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 16-Bit Value	All zeros	Specifies initial contents of the RAM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM16X1S_1

Primitive: 16-Deep by 1-Wide Static Synchronous RAM with Negative-Edge Clock



Introduction

This element is a 16-word by 1-bit static random access memory with synchronous write capability and negative-edge clock. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When (WE) is High, any negative transition on (WCLK) loads the data on the data input (D) into the word selected by the 4-bit address (A3:A0). For predictable performance, address and data inputs must be stable before a High-to-Low WCLK transition. This RAM block assumes an active-Low (WCLK). However, (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block.

The signal output on the data output pin (O) is the data that is stored in the RAM at the location defined by the values on the address pins.

You can initialize this element during configuration using the INIT attribute.

Logic Table

Inputs			Outputs
WE(mode)	**WCLK**	**D**	**O**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↓	D	D
1 (read)	↑	X	Data
Data = word addressed by bits A3:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

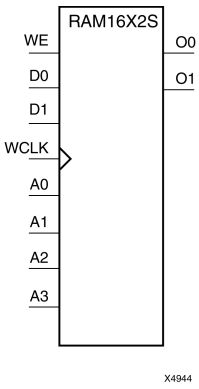
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 16-Bit Value	All zeros	Specifies initial contents of the RAM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM16X2S

Primitive: 16-Deep by 2-Wide Static Synchronous RAM



Introduction

This element is a 16-word by 2-bit static random access memory with synchronous write capability. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is High, any positive transition on WCLK loads the data on the data input (D1:D0) into the word selected by the 4-bit address (A3:A0). For predictable performance, address and data inputs must be stable before a Low-to-High WCLK transition. This RAM block assumes an active-High WCLK. However, WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The signal output on the data output pins (O1:O0) is the data that is stored in the RAM at the location defined by the values on the address pins.

You can use the INIT_xx properties to specify the initial contents of a wide RAM. INIT_00 initializes the RAM cells corresponding to the O0 output, INIT_01 initializes the cells corresponding to the O1 output, etc. For example, a RAM16X2S instance is initialized by INIT_00 and INIT_01 containing 4 hex characters each. A RAM16X8S instance is initialized by eight properties INIT_00 through INIT_07 containing 4 hex characters each. A RAM64x2S instance is completely initialized by two properties INIT_00 and INIT_01 containing 16 hex characters each.

Except for Virtex-4 devices, the initial contents of this element cannot be specified directly.

Logic Table

Inputs			**Outputs**
WE (mode)	**WCLK**	**D1:D0**	**O1:O0**
0 (read)	X	X	Data
1(read)	0	X	Data
1(read)	1	X	Data
1(write)	↑	D1:D0	D1:D0
1(read)	↓	X	Data
Data = word addressed by bits A3:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_01	Hexadecimal	Any 16-Bit Value	All zeros	Initializes RAMs, registers, and look-up tables.

For More Information

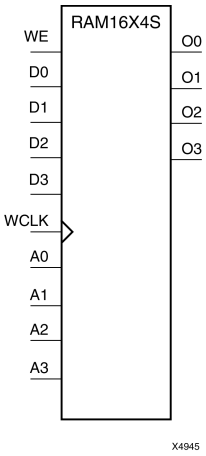
RAM16X4S

Primitive: 16-Deep by 4-Wide Static Synchronous RAM



Introduction

This element is a 16-word by 4-bit static random access memory with synchronous write capability. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is High, any positive transition on WCLK loads the data on the data input (D3:D0) into the word selected by the 4-bit address (A3:A0). For predictable performance, address and data inputs must be stable before a Low-to-High WCLK transition. This RAM block assumes an active-High WCLK. However, WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The signal output on the data output pins (O3:O0) is the data that is stored in the RAM at the location defined by the values on the address pins.

Logic Table

Inputs			Outputs
WE (mode)	**WCLK**	**D3:D0**	**O3:O0**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↑	D3:D0	D3:D0
1 (read)	↓	X	Data
Data = word addressed by bits A3:A0.			

Design Entry Method

This design element can be used in schematics.

Available Attributes

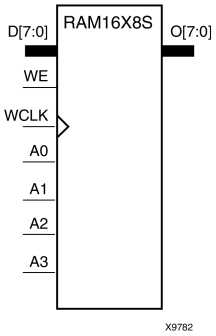
Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_03	Hexadecimal	Any 16-Bit Value	All zeros	INIT of RAM

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM16X8S

Primitive: 16-Deep by 8-Wide Static Synchronous RAM



Introduction

This element is a 16-word by 8-bit static random access memory with synchronous write capability. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is High, any positive transition on WCLK loads the data on data inputs (D7:D0) into the word selected by the 4-bit address (A3:A0). For predictable performance, address and data inputs must be stable before a Low-to-High WCLK transition. This RAM block assumes an active-High WCLK. However, WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The signal output on the data output pins (O7:O0) is the data that is stored in the RAM at the location defined by the values on the address pins.

Logic Table

Inputs			Outputs
WE (mode)	**WCLK**	**D7:D0**	**O7:O0**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↑	D7:D0	D7:D0
1 (read)	↓	X	Data
Data = word addressed by bits A3–A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

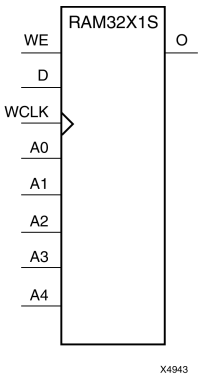
Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_07	Hexadecimal	Any 16-Bit Value	All zeros	Initializes RAMs, registers, and look-up tables.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM32X1S

Primitive: 32-Deep by 1-Wide Static Synchronous RAM



Introduction

The design element is a 32-word by 1-bit static random access memory with synchronous write capability. When the write enable is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When (WE) is High, any positive transition on (WCLK) loads the data on the data input (D) into the word selected by the 5-bit address (A4-A0). For predictable performance, address and data inputs must be stable before a Low-to-High (WCLK) transition. This RAM block assumes an active-High (WCLK). However, (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block.

The signal output on the data output pin (O) is the data that is stored in the RAM at the location defined by the values on the address pins. You can initialize RAM32X1S during configuration using the INIT attribute.

Logic Table

Inputs			Outputs
WE (Mode)	**WCLK**	**D**	**O**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↓	D	D
1 (read)	↑	X	Data

Design Entry Method

This design element can be used in schematics.

Available Attributes

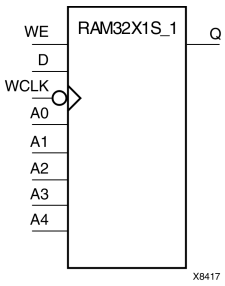
Attribute	Type	Allowed Values	Default	Descriptions
INIT	Hexadecimal	Any 32-Bit Value	All zeros	Specifies initial contents of the RAM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM32X1S_1

Primitive: 32-Deep by 1-Wide Static Synchronous RAM with Negative-Edge Clock



Introduction

The design element is a 32-word by 1-bit static random access memory with synchronous write capability. When the write enable is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When (WE) is High, any negative transition on (WCLK) loads the data on the data input (D) into the word selected by the 5-bit address (A4:A0). For predictable performance, address and data inputs must be stable before a High-to-Low (WCLK) transition. This RAM block assumes an active-Low (WCLK). However, (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block.

The signal output on the data output pin (O) is the data that is stored in the RAM at the location defined by the values on the address pins. You can initialize RAM32X1S_1 during configuration using the INIT attribute.

Logic Table

Inputs			Outputs
WE (Mode)	**WCLK**	**D**	**O**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↓	D	D
1 (read)	↑	X	Data
Data = word addressed by bits A4:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

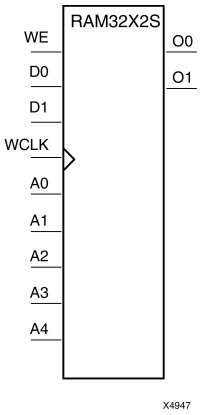
Attribute	Type	Allowed Values	Default	Descriptions
INIT	Hexadecimal	Any 32-Bit Value	0	Initializes RAMs, registers, and look-up tables.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM32X2S

Primitive: 32-Deep by 2-Wide Static Synchronous RAM



Introduction

The design element is a 32-word by 2-bit static random access memory with synchronous write capability. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When (WE) is High, any positive transition on (WCLK) loads the data on the data input (D1-D0) into the word selected by the 5-bit address (A4-A0). For predictable performance, address and data inputs must be stable before a Low-to-High (WCLK) transition. This RAM block assumes an active-High (WCLK). However, (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block. The signal output on the data output pins (O1-O0) is the data that is stored in the RAM at the location defined by the values on the address pins.

You can use the INIT_00 and INIT_01 properties to specify the initial contents of RAM32X2S.

Logic Table

Inputs			**Outputs**
WE (Mode)	**WCLK**	**D**	**O0-O1**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↑	D1:D0	D1:D0
1 (read)	↓	X	Data
Data = word addressed by bits A4:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

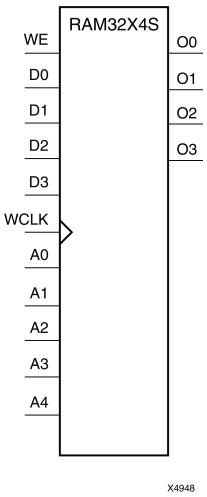
Attribute	Type	Allowed Values	Default	Descriptions
INIT_00	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 0 of RAM.
INIT_01	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 1 of RAM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM32X4S

Primitive: 32-Deep by 4-Wide Static Synchronous RAM



Introduction

This design element is a 32-word by 4-bit static random access memory with synchronous write capability. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is High, any positive transition on WCLK loads the data on the data inputs (D3-D0) into the word selected by the 5-bit address (A4:A0). For predictable performance, address and data inputs must be stable before a Low-to-High WCLK transition. This RAM block assumes an active-High WCLK. However, WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The signal output on the data output pins (O3-O0) is the data that is stored in the RAM at the location defined by the values on the address pins.

Logic Table

Inputs			Outputs
WE	**WCLK**	**D3-D0**	**O3-O0**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↑	D3:D0	D3:D0
1 (read)	↓	X	Data
Data = word addressed by bits A4:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

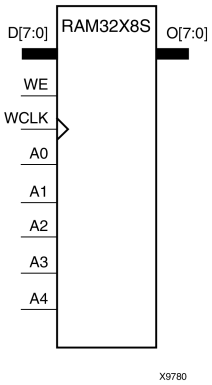
Attribute	Type	Allowed Values	Default	Description
INIT_00	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 0 of RAM.
INIT_01	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 1 of RAM.
INIT_02	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 2 of RAM.
INIT_03	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 3 of RAM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM32X8S

Primitive: 32-Deep by 8-Wide Static Synchronous RAM



Introduction

This design element is a 32-word by 8-bit static random access memory with synchronous write capability. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is High, any positive transition on WCLK loads the data on the data inputs (D7:D0) into the word selected by the 5-bit address (A4:A0). For predictable performance, address and data inputs must be stable before a Low-to-High WCLK transition. This RAM block assumes an active-High WCLK. However, WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The signal output on the data output pins (O7:O0) is the data that is stored in the RAM at the location defined by the values on the address pins.

Logic Table

Inputs			**Outputs**
WE (mode)	**WCLK**	**D7:D0**	**O7:O0**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↑	D7:D0	D7:D0
1 (read)	↓	X	Data
Data = word addressed by bits A4:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 0 of RAM.
INIT_01	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 1 of RAM.
INIT_02	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 2 of RAM.
INIT_03	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 3 of RAM.
INIT_04	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 4 of RAM.
INIT_05	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 5 of RAM.
INIT_06	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 6 of RAM.
INIT_07	Hexadecimal	Any 32-Bit Value	All zeros	INIT for bit 7 of RAM.

For More Information

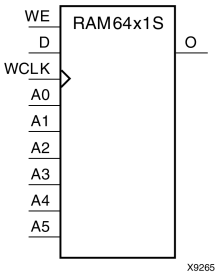
RAM64X1S

Primitive: 64-Deep by 1-Wide Static Synchronous RAM



Introduction

This design element is a 64-word by 1-bit static random access memory (RAM) with synchronous write capability. When the write enable is set Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is set High, any positive transition on WCLK loads the data on the data input (D) into the word selected by the 6-bit address (A5:A0). This RAM block assumes an active-High WCLK. However, WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The signal output on the data output pin (O) is the data that is stored in the RAM at the location defined by the values on the address pins.

You can initialize this element during configuration using the INIT attribute.

Logic Table

Mode selection is shown in the following logic table

Inputs			**Outputs**
WE (mode)	**WCLK**	**D**	**O**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↑	D	D
1 (read)	↓	X	Data
Data = word addressed by bits A5:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

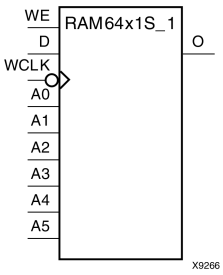
Attribute	**Type**	**Allowed Values**	**Default**	**Description**
INIT	Hexadecimal	Any 64-Bit Value	All zeros	Initializes ROMs, RAMs, registers, and look-up tables.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAM64X1S_1

Primitive: 64-Deep by 1-Wide Static Synchronous RAM with Negative-Edge Clock



Introduction

This design element is a 64-word by 1-bit static random access memory with synchronous write capability. When the write enable is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When (WE) is High, any negative transition on (WCLK) loads the data on the data input (D) into the word selected by the 6-bit address (A5:A0). For predictable performance, address and data inputs must be stable before a High-to-Low (WCLK) transition. This RAM block assumes an active-Low (WCLK). However, (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block.

The signal output on the data output pin (O) is the data that is stored in the RAM at the location defined by the values on the address pins.

You can initialize this element during configuration using the INIT attribute.

Logic Table

Inputs			Outputs
WE (mode)	**WCLK**	**D**	**O**
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↓	D	D
1 (read)	↑	X	Data
Data = word addressed by bits A5:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 64-Bit Value	All zeros	Initializes ROMs, RAMs, registers, and look-up tables.

For More Information

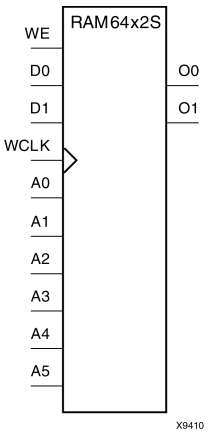
RAM64X2S

Primitive: 64-Deep by 2-Wide Static Synchronous RAM



Introduction

This design element is a 64-word by 2-bit static random access memory with synchronous write capability. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is High, any positive transition on WCLK loads the data on the data input (D1:D0) into the word selected by the 6-bit address (A5:A0). For predictable performance, address and data inputs must be stable before a Low-to-High WCLK transition. This RAM block assumes an active-High WCLK. However, WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The signal output on the data output pins (O1:O0) is the data that is stored in the RAM at the location defined by the values on the address pins. You can use the INIT_00 and INIT_01 properties to specify the initial contents of this design element.

Logic Table

Inputs			Outputs
WE (mode)	WCLK	D0:D1	O0:O1
0 (read)	X	X	Data
1 (read)	0	X	Data
1 (read)	1	X	Data
1 (write)	↑	D1:D0	D1:D0
1 (read)	↓	X	Data
Data = word addressed by bits A5:A0			

Design Entry Method

This design element can be used in schematics.

Available Attributes

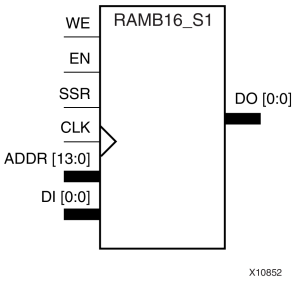
Attribute	Type	Allowed Values	Default	Description
INIT_00	Hexadecimal	Any 64-Bit Value	All zeros	Initializes RAMs, registers, and look-up tables.
INIT_01	Hexadecimal	Any 64-Bit Value	All zeros	Initializes RAMs, registers, and look-up tables.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAMB16_S1

Primitive: 16K-bit Data and 2K-bit Parity Single-Port Synchronous Block RAM with 1-bit Port



Introduction

This design element is a dedicated random access memory block with synchronous write capability. The block RAM port has 16384 bits of data memory. The cell configuration for this element is listed in the following table.

Data Cells		Parity Cells				
Depth	**Width**	**Depth**	**Width**	**Address Bus**	**Data Bus**	**Parity Bus**
16384	1	-	-	(13:0)	(0:0)	-

The enable EN pin controls read, write, and reset. When EN is Low, no data is written and the outputs (DO and DOP) retain the last state. When EN is High and reset (SSR) is High, DO and DOP are set to SRVAL during the Low-to-High clock (CLK) transition; if write enable (WE) is High, the memory contents reflect the data at DI and DIP. When EN is High and WE is Low, the data stored in the RAM address (ADDR) is read during the Low-to-High clock transition. By default, WRITE_MODE=WRITE_FIRST, when EN and WE are High, the data on the data inputs (DI and DIP) is loaded into the word selected by the write address (ADDR) during the Low-to-High clock transition and the data outputs (DO and DOP) reflect the selected (addressed) word.

The above description assumes an active High EN, WE, SSR, and CLK. However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Logic Table

Inputs								Outputs			
GSR	**EN**	**SSR**	**WE**	**CLK**	**ADDR**	**DI**	**DIP**	**DO**	**DOP**	**RAM Contents**	
										Data RAM	**Parity RAM**
1	X	X	X	X	X	X	X	INIT	INIT	No Change	No Change
0	0	X	X	X	X	X	X	No Change	No Change	No Change	No Change
0	1	1	0	↑	X	X	X	SRVAL	SRVAL	No Change	No Change
0	1	1	1	↑	addr	data	pdata	SRVAL	SRVAL	RAM(addr) =>data	RAM(addr) =>pdata
0	1	0	0	↑	addr	X	X	RAM (addr)	RAM (addr)	No Change	No Change
0	1	0	1	↑	addr	data	pdata	No Change[1] RAM	No Change[1] RAM	RAM (addr)=>data	RAM (addr)=>pdata

Inputs								Outputs			
GSR	EN	SSR	WE	CLK	ADDR	DI	DIP	DO	DOP	RAM Contents	
										Data RAM	Parity RAM
								(addr)[2] data[3]	(addr)[2] pdata[3]		

GSR=Global Set Reset signal

INIT=Value specified by the INIT attribute for data memory. Default is all zeros.

SRVAL=Value after assertion of SSR as specified by the SRVAL attribute.

addr=RAM address.

RAM(addr)=RAM contents at address ADDR.

data=RAM input data.

pdata=RAM parity data.

[1]WRITE_MODE=NO_CHANGE

[2]WRITE_MODE=READ_FIRST

[3]WRITE_MODE=WRITE_FIRST

Initialization

Initializing Memory Contents

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16 is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

Any INIT_xx or INITP_xx attribute that is not specified is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register

In Spartan®-3A and above devices, each bit in the output register can be initialized at power on to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Two types of properties control initialization of the output register for a single-port RAMB16: INIT and SRVAL. The INIT attribute specifies the output register value at power on. You can use the SRVAL attribute to define the state resulting from assertion of the SSR (set/reset) input.

The INIT and SRVAL attributes specify the initialization value as a hexadecimal String containing one bit for each bit in the output port. For example, for a RAMB16_S1 with port width equal to 1, the output register contains 1 bit. Therefore, the INIT or SRVAL value can only be specified as a 1 or 0. For RAMB16_S4 with port width equal to 4, the output register contains 4 bits. In this case, you can specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT or SRVAL value.

Selecting Write Mode

The WRITE_MODE attribute controls RAMB16 memory and output contents. By default, the WRITE_MODE is set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the WRITE_MODE to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the WRITE_MODE to NO_CHANGE to have the input written to memory without changing the output.

Design Entry Method

This design element can be used in schematics.

Available Attributes

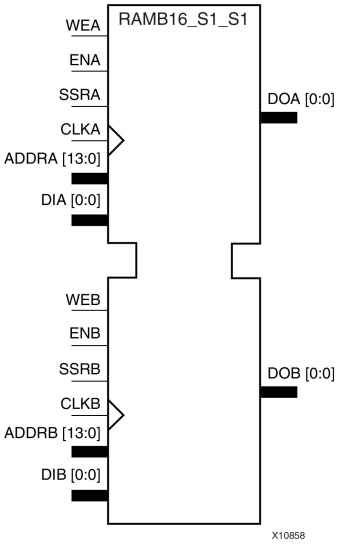
Attribute	Type	Allowed Values	Default	Description
INIT	Binary/ Hexadecimal	Any Hex Value	All zeros	Identifies the initial value of the DO output port after completing configuration. The bit width is dependent on the width of the A or B port of the RAM.
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any Hex Value	All zeros	Specifies the initial contents of the data portion of the RAM array.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any Hex Value	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SRVAL	Binary/ Hexadecimal	Any Hex Value	All zeros	Allows the individual selection of whether the DO output port sets (go to a one) or reset (go to a zero) upon the assertion of the SSR pin. The bit width is dependent on the width of the A or B port of the RAM.
WRITE_MODE	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE"	"WRITE_FIRST"	Specifies the behavior of the DO port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

RAMB16_S1_S1

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 1-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

RAMB16_S1_S1	16384 x 1	-	(13:0)	(0:0)	-	16384 x 1	-	(13:0)	(0:0)	-

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																															
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

4	4096	<--	7				6				5				4				3				2				1				0			
8	2048	<--	3								2								1								0							
16	1024	<--	1																0															
32	512	<--	0																															

Port Address Mapping for Parity

Parity Width	Port Parity Addresses															
1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, WARNING_ ONLY, "GENERATE_X_ ONLY, NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing

Attribute	Type	Allowed Values	Default	Description
				the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_ FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_ FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

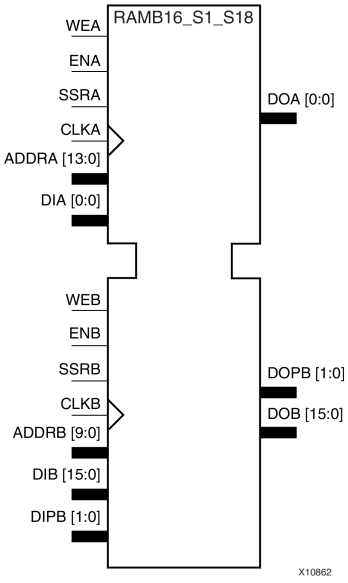
RAMB16_S1_S18

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 1-bit and 18-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

[1] Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																															
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

32	512	<--	0																														

Port Address Mapping for Parity

Parity Width	Port Parity Addresses															
1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexidecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexidecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexidecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexidecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, WARNING_ ONLY, "GENERATE_ X_ONLY, NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexidecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexidecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_ FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_ FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

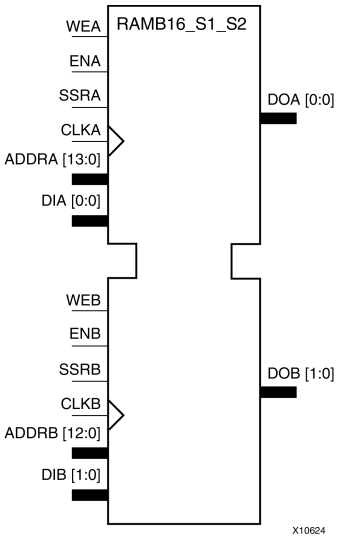
RAMB16_S1_S2

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 1-bit and 2-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

Port Descriptions

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S1_S2	16384 x 1	-	(13:0)	(0:0)	-	8192 x 2	-	(12:0)	(1:0)	-

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables show address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																																
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
2	8192	<--	15		14		13		12		11		10		9		8		7		6		5		4		3		2		1		0	
4	4096	<--	7				6				5				4				3				2				1				0		
8	2048	<--	3								2								1								0						
16	1024	<--	1																0														
32	512	<--	0																														

Port Address Mapping for Parity

Parity Width	Port Parity Addresses															
1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan-3A, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

WRITE_MODE_A=NO_CHANGE and WRITE_MODE_B=NO_CHANGE

RAMB16_S1_S4	16384 x 1	-	(13:0)	(0:0)	-	4096 x 4	-	(11:0)	(3:0)	-

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																															
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

4	4096	<--	7				6				5				4				3				2				1				0		
8	2048	<--	3								2								1								0						
16	1024	<--	1																0														
32	512	<--	0																														

Port Address Mapping for Parity

Parity Width	Port Parity Addresses															
1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

WRITE_MODE_A=NO_CHANGE and WRITE_MODE_B=NO_CHANGE

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, "WARNING_ ONLY", "GENERATE_ X_ONLY, NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.

Attribute	Type	Allowed Values	Default	Description
SRVAL_A	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_ FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_ FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

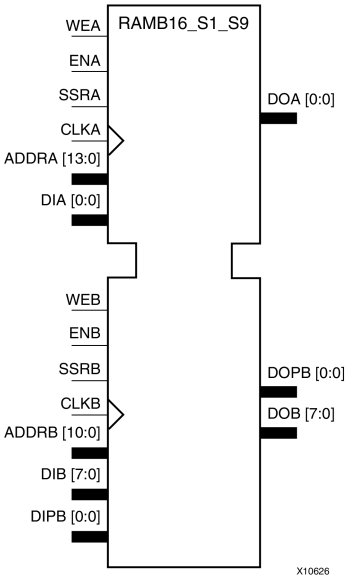
RAMB16_S1_S9

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 1-bit and 9-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S1_S9	16384 x 1	-	(13:0)	(0:0)	-	2048 x 8	2048 x 1	(10:0)	(7:0)	(0:0)

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																															
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

32	512	<--	0																														

Port Address Mapping for Parity

Parity Width	Port Parity Addresses															
1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, WARNING_ ONLY, "GENERATE_X_ ONLY, NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

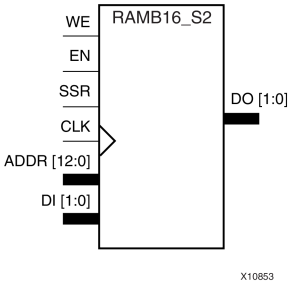
RAMB16_S2

Primitive: 16K-bit Data and 2K-bit Parity Single-Port Synchronous Block RAM with 2-bit Port



Introduction

This design element is a dedicated random access memory block with synchronous write capability. The block RAM port has 16384 bits of data memory. The cell configuration for this element is listed in the following table.

Data Cells		Parity Cells				
Depth	**Width**	**Depth**	**Width**	**Address Bus**	**Data Bus**	**Parity Bus**
8192	2	-	-	(12:0)	(1:0)	-

The enable EN pin controls read, write, and reset. When EN is Low, no data is written and the outputs (DO and DOP) retain the last state. When EN is High and reset (SSR) is High, DO and DOP are set to SRVAL during the Low-to-High clock (CLK) transition; if write enable (WE) is High, the memory contents reflect the data at DI and DIP. When EN is High and WE is Low, the data stored in the RAM address (ADDR) is read during the Low-to-High clock transition. By default, WRITE_MODE=WRITE_FIRST, when EN and WE are High, the data on the data inputs (DI and DIP) is loaded into the word selected by the write address (ADDR) during the Low-to-High clock transition and the data outputs (DO and DOP) reflect the selected (addressed) word.

The above description assumes an active High EN, WE, SSR, and CLK. However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Logic Table

Inputs								Outputs			
GSR	**EN**	**SSR**	**WE**	**CLK**	**ADDR**	**DI**	**DIP**	**DO**	**DOP**	**RAM Contents**	
										Data RAM	**Parity RAM**

										Data RAM	Parity RAM
								(addr)[2] data[3]	(addr)[2] pdata[3]		

GSR=Global Set Reset signal

INIT=Value specified by the INIT attribute for data memory. Default is all zeros.

SRVAL=Value after assertion of SSR as specified by the SRVAL attribute.

addr=RAM address.

RAM(addr)=RAM contents at address ADDR.

data=RAM input data.

pdata=RAM parity data.

[1]WRITE_MODE=NO_CHANGE

[2]WRITE_MODE=READ_FIRST

[3]WRITE_MODE=WRITE_FIRST

Initialization

Initializing Memory Contents

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16 is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

Any INIT_xx or INITP_xx attribute that is not specified is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register

In Spartan®-3A and above devices, each bit in the output register can be initialized at power on to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Two types of properties control initialization of the output register for a single-port RAMB16: INIT and SRVAL. The INIT attribute specifies the output register value at power on. You can use the SRVAL attribute to define the state resulting from assertion of the SSR (set/reset) input.

The INIT and SRVAL attributes specify the initialization value as a hexadecimal String containing one bit for each bit in the output port. For example, for a RAMB16_S1 with port width equal to 1, the output register contains 1 bit. Therefore, the INIT or SRVAL value can only be specified as a 1 or 0. For RAMB16_S4 with port width equal to 4, the output register contains 4 bits. In this case, you can specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT or SRVAL value.

Selecting Write Mode

The WRITE_MODE attribute controls RAMB16 memory and output contents. By default, the WRITE_MODE is set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the WRITE_MODE to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the WRITE_MODE to NO_CHANGE to have the input written to memory without changing the output.

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary/ Hexadecimal	Any Hex Value	All zeros	Identifies the initial value of the DO output port after completing configuration. The bit width is dependent on the width of the A or B port of the RAM.
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any Hex Value	All zeros	Specifies the initial contents of the data portion of the RAM array.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any Hex Value	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SRVAL	Binary/ Hexadecimal	Any Hex Value	All zeros	Allows the individual selection of whether the DO output port sets (go to a one) or reset (go to a zero) upon the assertion of the SSR pin. The bit width is dependent on the width of the A or B port of the RAM.
WRITE_MODE	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE"	"WRITE_FIRST"	Specifies the behavior of the DO port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

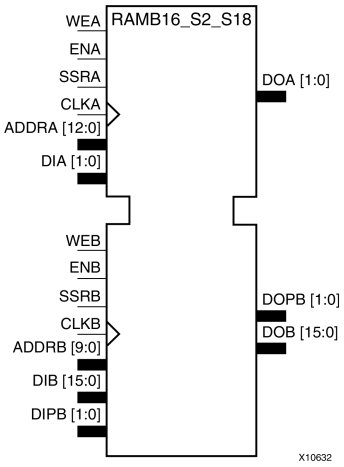
RAMB16_S2_S18

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 2-bit and 18-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

Logic Table

Port Descriptions

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S2_S18	8192 x 2	-	(12:0)	(1:0)	-	1024 x 16	1024 x 2	(9:0)	(15:0)	(1:0)

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																																
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
2	8192	<--	15		14		13		12		11		10		9		8		7		6		5		4		3		2		1		0	
4	4096	<--	7				6				5				4				3				2				1				0		
8	2048	<--	3								2								1								0						
16	1024	<--	1																0														
32	512	<--	0																														

Port Address Mapping for Parity

Parity Width	Port Parity Addresses															
1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectIO™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

WRITE_MODE_A=NO_CHANGE and WRITE_MODE_B=NO_CHANGE

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, WARNING_ ONLY, "GENERATE_X_ ONLY, NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

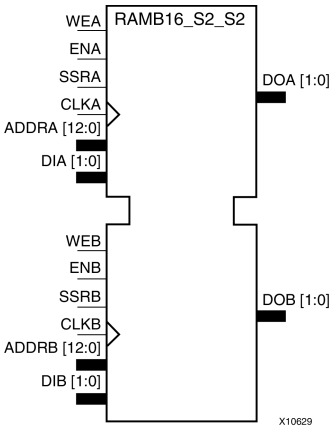
RAMB16_S2_S2

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 2-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

Port Descriptions

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S2_S2	8192 x 2	-	(12:0)	(1:0)	-	8192 x 2	-	(12:0)	(1:0)	-

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																																
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
2	8192	<--	15		14		13		12		11		10		9		8		7		6		5		4		3		2		1		0	
4	4096	<--	7				6				5				4				3				2				1				0		
8	2048	<--	3								2								1								0						
16	1024	<--	1																0														
32	512	<--	0																														

Port Address Mapping for Parity

Parity Width	Port Parity Addresses														
1	2048	<-----	3				2				1				0
2	1024	<-----	1								0				
4	512	<-----	0												

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

WRITE_MODE_A=NO_CHANGE and WRITE_MODE_B=NO_CHANGE

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexidecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexidecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexidecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexidecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, WARNING_ ONLY, "GENERATE_X_ ONLY, or NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexidecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexidecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE	"WRITE_ FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE	"WRITE_ FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

Port Descriptions

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S2_S4	8192 x 2	-	(12:0)	(1:0)	-	4096 x 4	-	(11:0)	(3:0)	-

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																															
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

WRITE_MODE_A=NO_CHANGE and WRITE_MODE_B=NO_CHANGE

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexidecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexidecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexidecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexidecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, NONE, WARNING, or "GENERATE_ X_ONLY	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexidecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexidecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

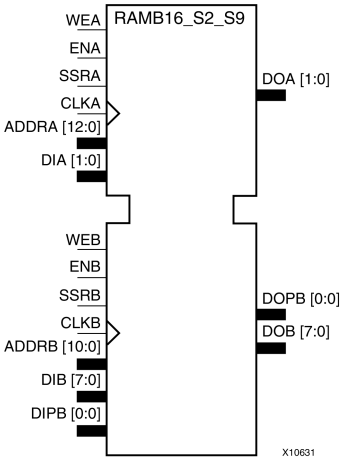
RAMB16_S2_S9

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 2-bit and 9-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

Port Descriptions

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S2_S9	8192 x 2	-	(12:0)	(1:0)	-	2048 x 8	2048 x 1	(10:0)	(7:0)	(0:0)

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																																
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1	2048	<-----	3				2				1				0
2	1024	<-----	1								0				
4	512	<-----	0												

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan®-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexidecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexidecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexidecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexidecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, NONE, WARNING, or "GENERATE_X_ ONLY	"ALL	Specifies the behavior during simulation in the event of a data collision (data being read or written to the same address from both ports of the Ram simultaneously. "ALL" issues a warning to simulator console and generate an X or all unknown data due to the collision. This is the recommended setting. "WARNING" generates a warning only and "GENERATE_X_ONLY" generates an X for unknown data but wont output the occurrence to the simulation console. "NONE" completely ignores the error. It is suggested to only change this attribute if you can ensure the data generated during a collision is discarded.
SRVAL_A	Binary/ Hexidecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexidecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

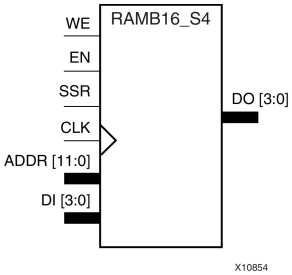
RAMB16_S4

Primitive: 16K-bit Data and 2K-bit Parity Single-Port Synchronous Block RAM with 4-bit Port



Introduction

This design element is a dedicated random access memory block with synchronous write capability. The block RAM port has 16384 bits of data memory. The cell configuration for this element is listed in the following table.

Data Cells		Parity Cells				
Depth	**Width**	**Depth**	**Width**	**Address Bus**	**Data Bus**	**Parity Bus**
4096	4	-	-	(11:0)	(3:0)	-

The enable EN pin controls read, write, and reset. When EN is Low, no data is written and the outputs (DO and DOP) retain the last state. When EN is High and reset (SSR) is High, DO and DOP are set to SRVAL during the Low-to-High clock (CLK) transition; if write enable (WE) is High, the memory contents reflect the data at DI and DIP. When EN is High and WE is Low, the data stored in the RAM address (ADDR) is read during the Low-to-High clock transition. By default, WRITE_MODE=WRITE_FIRST, when EN and WE are High, the data on the data inputs (DI and DIP) is loaded into the word selected by the write address (ADDR) during the Low-to-High clock transition and the data outputs (DO and DOP) reflect the selected (addressed) word.

The above description assumes an active High EN, WE, SSR, and CLK. However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Logic Table

Inputs								Outputs

RAM(addr)=RAM contents at address ADDR. data=RAM input data. pdata=RAM parity data. [1]WRITE_MODE=NO_CHANGE [2]WRITE_MODE=READ_FIRST [3]WRITE_MODE=WRITE_FIRST											

Initialization

Initializing Memory Contents

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16 is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

Any INIT_xx or INITP_xx attribute that is not specified is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register

In Spartan®-3A and above devices, each bit in the output register can be initialized at power on to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Two types of properties control initialization of the output register for a single-port RAMB16: INIT and SRVAL. The INIT attribute specifies the output register value at power on. You can use the SRVAL attribute to define the state resulting from assertion of the SSR (set/reset) input.

The INIT and SRVAL attributes specify the initialization value as a hexadecimal String containing one bit for each bit in the output port. For example, for a RAMB16_S1 with port width equal to 1, the output register contains 1 bit. Therefore, the INIT or SRVAL value can only be specified as a 1 or 0. For RAMB16_S4 with port width equal to 4, the output register contains 4 bits. In this case, you can specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT or SRVAL value.

Selecting Write Mode

The WRITE_MODE attribute controls RAMB16 memory and output contents. By default, the WRITE_MODE is set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the WRITE_MODE to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the WRITE_MODE to NO_CHANGE to have the input written to memory without changing the output.

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary/ Hexadecimal	Any Hex Value	All zeros	Identifies the initial value of the DO output port after completing configuration. The bit width is dependent on the width of the A or B port of the RAM.
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any Hex Value	All zeros	Specifies the initial contents of the data portion of the RAM array.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any Hex Value	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SRVAL	Binary/ Hexadecimal	Any Hex Value	All zeros	Allows the individual selection of whether the DO output port sets (go to a one) or reset (go to a zero) upon the assertion of the SSR pin. The bit width is dependent on the width of the A or B port of the RAM.
WRITE_MODE	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE"	"WRITE_FIRST"	Specifies the behavior of the DO port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

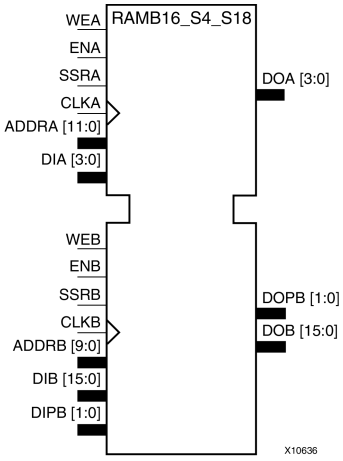
RAMB16_S4_S18

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 4-bit and 18-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

Logic Table

Truth Table A

Inputs								Outputs

Port Descriptions

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S4_S18	4096 x 4	-	(11:0)	(3:0)	-	1024 x 16	1024 x 2	(9:0)	(15:0)	(1:0)

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

Port Address Mapping for Data

Data Width	Port Data Addresses																															
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
2	8192	<--	15		14		13		12		11		10		9		8		7		6		5		4		3		2		1		0	
4	4096	<--	7				6				5				4				3				2				1				0		
8	2048	<--	3								2								1								0						
16	1024	<--	1																0														
32	512	<--	0																														

Port Address Mapping for Parity

Parity Width	Port Parity Addresses															
1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

WRITE_MODE_A=NO_CHANGE and WRITE_MODE_B=NO_CHANGE

WEA	WEB	CLKA	CLKB	DIA	DIB	DIPA	DIPB	DOA	DOB	DOPA	DOPB	Data RAM	Parity Ram

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, WARNING_ ONLY, "GENERATE_X_ ONLY, NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

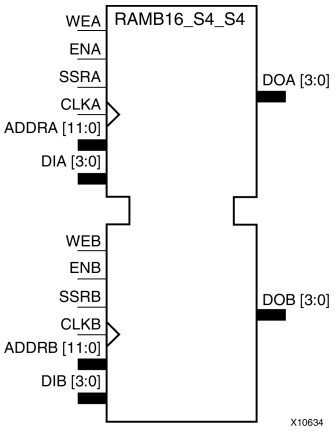
RAMB16_S4_S4

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 4-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

Logic Table

Port Descriptions

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S4_S4	4096 x 4	-	(11:0)	(3:0)	-	4096 x 4	-	(11:0)	(3:0)	-

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																																
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

32	512	<--	0																														

Port Address Mapping for Parity

Parity Width	Port Parity Addresses															
1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

WRITE_MODE_A=NO_CHANGE and WRITE_MODE_B=NO_CHANGE

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, WARNING_ ONLY, "GENERATE_X_ ONLY, NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

Port Descriptions

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S4_S9	4096 x 4	-	(11:0)	(3:0)	-	2048 x 8	2048 x 1	(10:0)	(7:0)	(0:0)

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables shows address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																															
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

8	2048	<--	3								2								1								0						
16	1024	<--	1																0														
32	512	<--	0																														

Port Address Mapping for Parity

Parity Width	Port Parity Addresses															
1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

WRITE_MODE_A=NO_CHANGE and WRITE_MODE_B=NO_CHANGE

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, WARNING_ ONLY, "GENERATE_X_ ONLY, NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

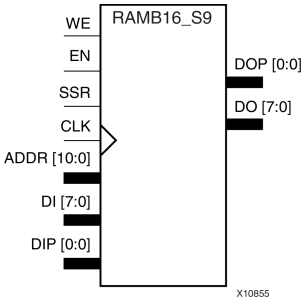
RAMB16_S9

Primitive: 16K-bit Data and 2K-bit Parity Single-Port Synchronous Block RAM with 9-bit Port



Introduction

This design element is a dedicated random access memory block with synchronous write capability. The block RAM port has 16384 bits of data memory. The cell configuration for this element is listed in the following table.

Data Cells		Parity Cells				
Depth	**Width**	**Depth**	**Width**	**Address Bus**	**Data Bus**	**Parity Bus**
2048	8	2048	1	(10:0)	(7:0)	(0:0)

The enable EN pin controls read, write, and reset. When EN is Low, no data is written and the outputs (DO and DOP) retain the last state. When EN is High and reset (SSR) is High, DO and DOP are set to SRVAL during the Low-to-High clock (CLK) transition; if write enable (WE) is High, the memory contents reflect the data at DI and DIP. When EN is High and WE is Low, the data stored in the RAM address (ADDR) is read during the Low-to-High clock transition. By default, WRITE_MODE=WRITE_FIRST, when EN and WE are High, the data on the data inputs (DI and DIP) is loaded into the word selected by the write address (ADDR) during the Low-to-High clock transition and the data outputs (DO and DOP) reflect the selected (addressed) word.

The above description assumes an active High EN, WE, SSR, and CLK. However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Logic Table

Inputs								Outputs			
GSR	**EN**	**SSR**	**WE**	**CLK**	**ADDR**	**DI**	**DIP**	**DO**	**DOP**	**RAM Contents**	
										Data RAM	**Parity RAM**

										Data RAM	Parity RAM
								(addr)[2] data[3]	(addr)[2] pdata[3]		

GSR=Global Set Reset signal

INIT=Value specified by the INIT attribute for data memory. Default is all zeros.

SRVAL=Value after assertion of SSR as specified by the SRVAL attribute.

addr=RAM address.

RAM(addr)=RAM contents at address ADDR.

data=RAM input data.

pdata=RAM parity data.

[1]WRITE_MODE=NO_CHANGE

[2]WRITE_MODE=READ_FIRST

[3]WRITE_MODE=WRITE_FIRST

Initialization

Initializing Memory Contents

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16 is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

Any INIT_xx or INITP_xx attribute that is not specified is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register

In Spartan®-3A and above devices, each bit in the output register can be initialized at power on to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Two types of properties control initialization of the output register for a single-port RAMB16: INIT and SRVAL. The INIT attribute specifies the output register value at power on. You can use the SRVAL attribute to define the state resulting from assertion of the SSR (set/reset) input.

The INIT and SRVAL attributes specify the initialization value as a hexadecimal String containing one bit for each bit in the output port. For example, for a RAMB16_S1 with port width equal to 1, the output register contains 1 bit. Therefore, the INIT or SRVAL value can only be specified as a 1 or 0. For RAMB16_S4 with port width equal to 4, the output register contains 4 bits. In this case, you can specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT or SRVAL value.

Selecting Write Mode

The WRITE_MODE attribute controls RAMB16 memory and output contents. By default, the WRITE_MODE is set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the WRITE_MODE to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the WRITE_MODE to NO_CHANGE to have the input written to memory without changing the output.

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Binary/ Hexadecimal	Any Hex Value	All zeros	Identifies the initial value of the DO output port after completing configuration. The bit width is dependent on the width of the A or B port of the RAM.
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any Hex Value	All zeros	Specifies the initial contents of the data portion of the RAM array.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any Hex Value	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SRVAL	Binary/ Hexadecimal	Any Hex Value	All zeros	Allows the individual selection of whether the DO output port sets (go to a one) or reset (go to a zero) upon the assertion of the SSR pin. The bit width is dependent on the width of the A or B port of the RAM.
WRITE_MODE	String	"WRITE_FIRST", "READ_FIRST" or "NO_CHANGE"	"WRITE_FIRST"	Specifies the behavior of the DO port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

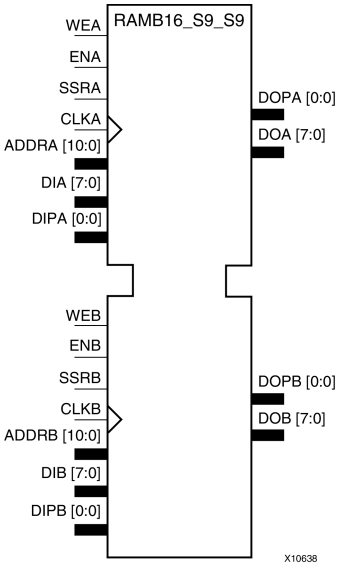
RAMB16_S9_S9

Primitive: 16K-bit Data and 2K-bit Parity Dual-Port Synchronous Block RAM with 9-bit Ports



Introduction

This design element is a dual-ported dedicated random access memory block with synchronous write capability. Each block RAM port has 16384 bits of data memory. Ports configured as 9, 18, or 36 bits wide have an additional 2048 bits of parity memory. Each port is independent of the other while accessing the same set of 16384 data memory cells. Each port is independently configured to a specific data width. The possible port and cell configurations for this element are listed in the "Port Descriptions" section.

Logic Table

Truth Table A

Port Descriptions

Port A						Port B				
Design Element	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus	Data Cells[1]	Parity Cells[1]	Address Bus	Data Bus	Parity Bus
RAMB16_S9_S9	2048 x 8	2048 x 1	(10:0)	(7:0)	(0:0)	2048 x 8	2048 x 1	(10:0)	(7:0)	(0:0)

[1]Depth x Width

Each port is fully synchronous with independent clock pins. All Port A input pins have setup time referenced to the CLKA pin and its data output bus DOA has a clock-to-out time referenced to the CLKA. All Port B input pins have setup time referenced to the CLKB pin and its data output bus DOB has a clock-to-out time referenced to the CLKB. The enable ENA pin controls read, write, and reset for Port A. When ENA is Low, no data is written and the outputs (DOA and DOPA) retain the last state. When ENA is High and reset (SSRA) is High, DOA and DOPA are set to SRVAL_A during the Low-to-High clock (CLKA) transition; if write enable (WEA) is High, the memory contents reflect the data at DIA and DIPA. When ENA is High and WEA is Low, the data stored in the RAM address (ADDRA) is read during the Low-to-High clock transition. By default, WRITE_MODE_A=WRITE_FIRST, when ENA and WEA are High, the data on the data inputs (DIA and DIPA) is loaded into the word selected by the write address (ADDRA) during the Low-to-High clock transition and the data outputs (DOA and DOPA) reflect the selected (addressed) word.

The enable ENB pin controls read, write, and reset for Port B. When ENB is Low, no data is written and the outputs (DOB and DOPB) retain the last state. When ENB is High and reset (SSRB) is High, DOB and DOPB are set to SRVAL_B during the Low-to-High clock (CLKB) transition; if write enable (WEB) is High, the memory contents reflect the data at DIB and DIPB. When ENB is High and WEB is Low, the data stored in the RAM address (ADDRB) is read during the Low-to-High clock transition. By default, WRITE_MODE_B=WRITE_FIRST, when ENB and WEB are High, the data on the data inputs (DIB and PB) are loaded into the word selected by the write address (ADDRB) during the Low-to-High clock transition and the data outputs (DOB and DOPB) reflect the selected (addressed) word. The above descriptions assume active High control pins (ENA, WEA, SSRA, CLKA, ENB, WEB, SSRB, and CLKB). However, the active level can be changed by placing an inverter on the port. Any inverter placed on a RAMB16 port is absorbed into the block and does not use a CLB resource.

Address Mapping

Each port accesses the same set of 18432 memory cells using an addressing scheme that is dependent on the width of the port. For all port widths, 16384 memory cells are available for data as shown in the Port Address Mapping for Data table below. For 9-, 18-, and 36-bit wide ports, 2408 parity memory cells are also available as shown in Port Address Mapping for Parity table below. The physical RAM location that is addressed for a particular width is determined from the following formula.

Start=((ADDR port+1)*(Widthport)) -1

End=(ADDRport)*(Widthport)

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

The following tables show address mapping for each port width.

Port Address Mapping for Data

Data Width	Port Data Addresses																																
1	16384	<--	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1	2048	<-----	3				2				1				0	
2	1024	<-----	1								0					
4	512	<-----	0													

Initializing Memory Contents of a Dual-Port RAMB16

You can use the INIT_xx attributes to specify an initialization value for the memory contents of a RAMB16 during device configuration. The initialization of each RAMB16_Sm_Sn is set by 64 initialization attributes (INIT_00 through INIT_3F) of 64 hex values for a total of 16384 bits.

You can use the INITP_xx attributes to specify an initial value for the parity memory during device configuration or assertion. The initialization of the parity memory for ports configured for 9, 18, or 36 bits is set by 8 initialization attributes (INITP_00 through INITP_07) of 64 hex values for a total of 2048 bits.

If any INIT_xx or INITP_xx attribute is not specified, it is configured as zeros. Partial Strings are padded with zeros to the left.

Initializing the Output Register of a Dual-Port RAMB16

In Spartan®-3A and above devices, each bit in an output register can be initialized at power on (when GSR is high) to either a 0 or 1. In addition, the initial state specified for power on can be different than the state that results from assertion of a set/reset. Four properties control initialization of the output register for a dual-port RAMB16: INIT_A, INIT_B, SRVAL_A, and SRVAL_B. The INIT_A attribute specifies the output register value at power on for Port A and the INIT_B attribute specifies the value for Port B. You can use the SRVAL_A attribute to define the state resulting from assertion of the SSR (set/reset) input on Port A. You can use the SRVAL_B attribute to define the state resulting from assertion of the SSR input on Port B.

The INIT_A, INIT_B, SRVAL_A, and SRVAL_B attributes specify the initialization value as a hexadecimal String. The value is dependent upon the port width. For example, for a RAMB16_S1_S4 with Port A width equal to 1 and Port B width equal to 4, the Port A output register contains 1 bit and the Port B output register contains 4 bits. Therefore, the INIT_A or SRVAL_A value can only be specified as a 1 or 0. For Port B, the output register contains 4 bits. In this case, you can use INIT_B or SRVAL_B to specify a hexadecimal value from 0 through F to initialize the 4 bits of the output register.

For those ports that include parity bits, the parity portion of the output register is specified in the high order bit position of the INIT_A, INIT_B, SRVAL_A, or SRVAL_B value.

The INIT and SRVAL attributes default to zero if they are not set by you.

Write Mode Selection

The WRITE_MODE_A attribute controls the memory and output contents of Port A for a dual-port RAMB16. The WRITE_MODE_B attribute does the same for Port B. By default, both WRITE_MODE_A and WRITE_MODE_B are set to WRITE_FIRST. This means that input is read, written to memory, and then passed to output. You can set the write mode for Port A and Port B to READ_FIRST to read the memory contents, pass the memory contents to the outputs, and then write the input to memory. Or, you can set the write mode to NO_CHANGE to have the input written to memory without changing the output. The Port A and Port B Conflict Resolution section describes how read/write conflicts are resolved when both Port A and Port B are attempting to read/write to the same memory cells.

Port A and Port B Conflict Resolution

Spartan-3A block SelectRAM™ is True Dual-Port RAM that allows both ports to simultaneously access the same memory cell. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window.

The following tables summarize the collision detection behavior of the dual-port RAMB16 based on the WRITE_MODE_A and WRITE_MODE_B settings.

WRITE_MODE_A=NO_CHANGE and WRITE_MODE_B=NO_CHANGE

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT_00 to INIT_3F	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the data portion of the RAM array.
INIT_A	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INIT_B	Binary/ Hexadecimal	Any	All zeros	Identifies the initial value of the DOA/DOB output port after completing configuration. For Type, the bit width is dependent on the width of the A or B port of the RAM.
INITP_00 to INITP_07	Binary/ Hexadecimal	Any	All zeros	Specifies the initial contents of the parity portion of the RAM array.
SIM_COLLISION_ CHECK	String	"ALL, WARNING_ ONLY, "GENERATE_X_ ONLY, NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTA pin. For Type, the bit width is dependent on the width of the A port of the RAM.
SRVAL_B	Binary/ Hexadecimal	Any	All zeros	Allows the individual selection of whether the DOA/DOB output port sets (go to a one) or reset (go to a zero) upon the assertion of the RSTB pin. For Type, the bit width is dependent on the width of the B port of the RAM.

Attribute	Type	Allowed Values	Default	Description
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE	"WRITE_FIRST	Specifies the behavior of the DOA/DOB port upon a write command to the respected port. If set to "WRITE_FIRST", the same port that is written to displays the contents of the written data to the outputs upon completion of the operation. "READ_FIRST" displays the prior contents of the RAM to the output port prior to writing the new data. "NO_CHANGE" keeps the previous value on the output port and wont update the output port upon a write command. This is the suggested mode if not using the read data from a particular port of the RAM.

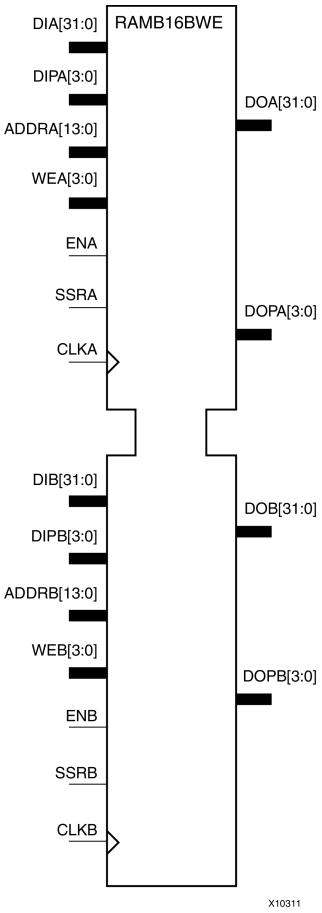
RAMB16BWE

Primitive: 16K-bit Data and 2K-bit Parity Configurable Synchronous Dual Port Block RAM



Introduction

This design element can be configured and used as a 1-bit wide by 16K deep to a 36-bit wide by 512 deep single-port or dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, Port A and Port B may operate fully independently and asynchronously to each other accessing the same memory array. When configured in the wider data width modes, byte-enable write operations are possible. This block RAM memory offers fast and flexible storage of large amounts of on-chip data.

Port Descriptions

Port	Direction	Width	Function
DOA, DOB	Output	32	Port A/B data output bus.
DOPA, DOPB	Output	4	Port A/B parity output bus.
DIA, DIB	Input	32	Port A/B data input bus.
DIPA, DIPB	Input	4	Port A/B parity input bus.
ADDRA, ADDRB	Input	14	Port A/B address input bus. MSB always exists on ADDRA/B while the LSB is determined by the settings for DATA_WIDTH_A/B.

Port	Direction	Width	Function
WEA, WEB	Input	4	Port A/B byte-wide write enable.
ENA, ENB	Input	1	Port A/B enable
SSRA, SSRB	Input	1	Port A/B output registers synchronous reset.
CLKA, CLKB	Input	1	Port A/B clock input.

Design Entry Method

This design element can be used in schematics.

This element can be inferred by most synthesis tools by properly describing the RAM behavior in standard RTL code (consult synthesis tool documentation for details). Alternatively, CORE Generator™ can also create the desired macro for this RAM. If it is desired to have more control over the implementation or placement of this component, it may also be directly instantiated. To instantiate this component, use the HDL templates in the ISE® software or the instantiation template below and paste into your code. Connect all necessary inputs to the desired signals in the design. The CLKA/CLKB clock signals must be tied to an active clock for RAM operation and the SSRA/SSRB reset signals must be either tied to a logic zero or to the proper reset signal. ENA/ENB must either be tied to a logic one or a proper RAM port enable signal. Refer to the DATA_WIDTH table below for the necessary data input, data output, write enable and address connection information for each DATA_WIDTH setting as the necessary connections for these signals change based on this attribute. All other output signals can be left unconnected (open) and all unused input signals should be tied to a logic zero.

The following table shows the necessary input and output connections for the variable input ports for each DATA_WIDTH values for either Port A or Port B:

DATA_WIDTH Value	DI, DIP Connections	ADDR Connections	WE Connections	DO, DOP Connections
1	DI[0]	ADDR[13:0]	Connect WE[3:0] to single user WE signal	DO[0]
2	DI[1:0]	ADDR[13:1]	Connect WE[3:0] to single user WE signal	DO[1:0]
4	DI[3:0]	ADDR[13:2]	Connect WE[3:0] to single user WE signal	DO[3:0]
9	DI[7:0], DIP[0]	ADDR[13:3]	Connect WE[3:0] to single user WE signal	DO[7:0], DOP[0]
18	DI[15:0], DIP[1:0]	ADDR[13:4]	Connect WE[0] and WE[2] to user WE[0] and WE[1] and WE[3] to user WE[1]	DO[15:0], DOP[1:0]
36	DI[31:0], DIP[3:0]	ADDR[13:5]	Connect each WE[3:0] signal to the associated byte write enable.	DO[31:0], DOP[3:0]

Alternatively, the prior RAMB16_Sm_Sn design elements can be instantiated if a byte-enable operation is not necessary. Also, new convenience macros called RAMB16BWE_Sm_Sn are provided to allow for easier instantiation of this RAM with byte-enable operation. If either of these components is used, the software automatically re-targets it to a properly configured RAMB16BWE component.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
DATA_WIDTH_A, DATA_WIDTH_B	Integer	0, 1, 2, 4, 9, 18, or 36	0	Specifies the configurable data width for Ports A and B.
INIT_A, INIT_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the initial value on the Port B output after configuration.
SIM_COLLISION_CHECK	String	ALL, "WARNING_ONLY", "GENERATE_X_ONLY" or "NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A, SRVAL_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the output value of Port B upon the assertion of the synchronous reset (SSRB) signal.
WRITE_MODE_A, WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", or "NO_CHANGE	"WRITE_FIRST	Specifies output behavior of the port being written to: • WRITE_FIRST" = written value appears on output port of the RAM. • READ_FIRST = previous RAM contents for that memory location appear on the output port. • NO_CHANGE = previous value on the output port remains the same.
INIT_00 to INIT_3F	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 16kb data memory array.
INITP_00 to INITP_07	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 2kb parity data memory array.

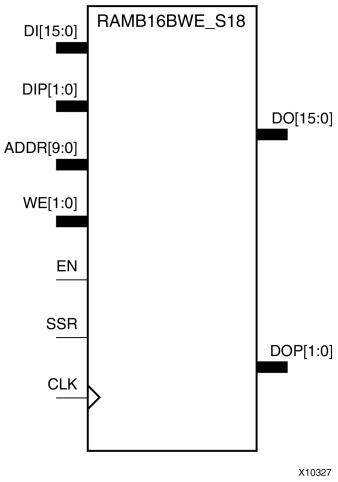
RAMB16BWE_S18

Primitive: 16K-bit Data and 2K-bit Parity Synchronous Single Port Block RAM with 18-bit Port



Introduction

This design element can be configured and used as a 1-bit wide by 16K deep to a 36-bit wide by 512 deep single-port or dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, Port A and Port B may operate fully independently and asynchronously to each other accessing the same memory array. When configured in the wider data width modes, byte-enable write operations are possible. This block RAM memory offers fast and flexible storage of large amounts of on-chip data.

Port Descriptions

Port	Direction	Width	Function
DOA, DOB	Output	32	Port A/B data output bus.
DOPA, DOPB	Output	4	Port A/B parity output bus.
DIA, DIB	Input	32	Port A/B data input bus.
DIPA, DIPB	Input	4	Port A/B parity input bus.
ADDRA, ADDRB	Input	14	Port A/B address input bus. MSB always exists on ADDRA/B while the LSB is determined by the settings for DATA_WIDTH_A/B.
WEA, WEB	Input	4	Port A/B byte-wide write enable.
ENA, ENB	Input	1	Port A/B enable
SSRA, SSRB	Input	1	Port A/B output registers synchronous reset.
CLKA, CLKB	Input	1	Port A/B clock input.

Design Entry Method

This design element can be used in schematics.

This element can be inferred by most synthesis tools by properly describing the RAM behavior in standard RTL code (consult synthesis tool documentation for details). Alternatively, CORE Generator™ can also create the desired macro for this RAM. If it is desired to have more control over the implementation or placement of this component, it may also be directly instantiated. To instantiate this component, use the HDL templates in the ISE® software or the instantiation template below and paste into your code. Connect all necessary inputs to the desired signals in the design. The CLKA/CLKB clock signals must be tied to an active clock for RAM operation and the SSRA/SSRB reset signals must be either tied to a logic zero or to the proper reset signal. ENA/ENB must either be tied to a logic one or a proper RAM port enable signal. Refer to the DATA_WIDTH table below for the necessary data input, data output, write enable and address connection information for each DATA_WIDTH setting as the necessary connections for these signals change based on this attribute. All other output signals can be left unconnected (open) and all unused input signals should be tied to a logic zero.

The following table shows the necessary input and output connections for the variable input ports for each DATA_WIDTH values for either Port A or Port B:

DATA_WIDTH Value	DI, DIP Connections	ADDR Connections	WE Connections	DO, DOP Connections
1	DI[0]	ADDR[13:0]	Connect WE[3:0] to single user WE signal	DO[0]
2	DI[1:0]	ADDR[13:1]	Connect WE[3:0] to single user WE signal	DO[1:0]
4	DI[3:0]	ADDR[13:2]	Connect WE[3:0] to single user WE signal	DO[3:0]
9	DI[7:0], DIP[0]	ADDR[13:3]	Connect WE[3:0] to single user WE signal	DO[7:0], DOP[0]
18	DI[15:0], DIP[1:0]	ADDR[13:4]	Connect WE[0] and WE[2] to user WE[0] and WE[1] and WE[3] to user WE[1]	DO[15:0], DOP[1:0]
36	DI[31:0], DIP[3:0]	ADDR[13:5]	Connect each WE[3:0] signal to the associated byte write enable.	DO[31:0], DOP[3:0]

Alternatively, the prior RAMB16_Sm_Sn design elements can be instantiated if a byte-enable operation is not necessary. Also, new convenience macros called RAMB16BWE_Sm_Sn are provided to allow for easier instantiation of this RAM with byte-enable operation. If either of these components is used, the software automatically re-targets it to a properly configured RAMB16BWE component.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
DATA_WIDTH_A, DATA_WIDTH_B	Integer	0, 1, 2, 4, 9, 18, or 36	0	Specifies the configurable data width for Ports A and B.
INIT_A, INIT_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the initial value on the Port B output after configuration.
SIM_COLLISION_CHECK	String	ALL, "WARNING_ONLY", "GENERATE_X_ONLY" or "NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value.

Attribute	Type	Allowed Values	Default	Description
				• "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A, SRVAL_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the output value of Port B upon the assertion of the synchronous reset (SSRB) signal.
WRITE_MODE_A, WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", or "NO_CHANGE	"WRITE_FIRST	Specifies output behavior of the port being written to: • WRITE_FIRST" = written value appears on output port of the RAM. • READ_FIRST = previous RAM contents for that memory location appear on the output port. • NO_CHANGE = previous value on the output port remains the same.
INIT_00 to INIT_3F	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 16kb data memory array.
INITP_00 to INITP_07	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 2kb parity data memory array.

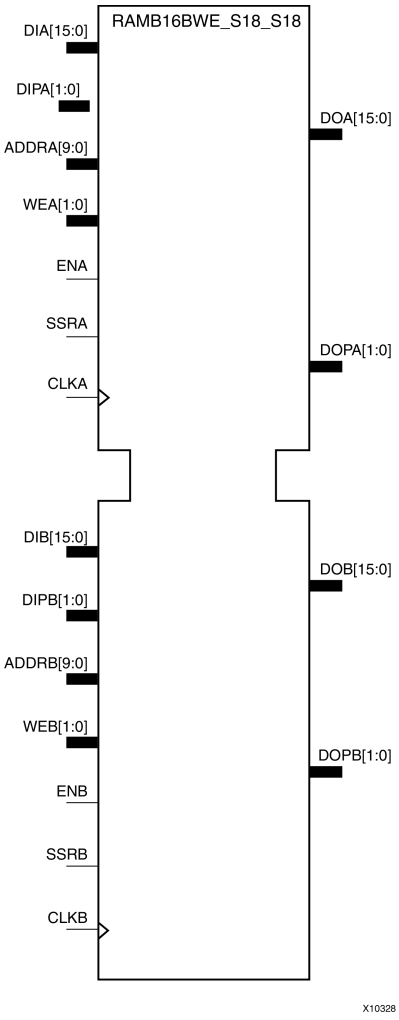
RAMB16BWE_S18_S18

Primitive: 16K-bit Data and 2K-bit Parity Synchronous Dual Port Block RAM with 18-bit Ports



Introduction

This design element can be configured and used as a 1-bit wide by 16K deep to a 36-bit wide by 512 deep single-port or dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, Port A and Port B may operate fully independently and asynchronously to each other accessing the same memory array. When configured in the wider data width modes, byte-enable write operations are possible. This block RAM memory offers fast and flexible storage of large amounts of on-chip data.

Port Descriptions

Port	Direction	Width	Function
DOA, DOB	Output	32	Port A/B data output bus.
DOPA, DOPB	Output	4	Port A/B parity output bus.
DIA, DIB	Input	32	Port A/B data input bus.
DIPA, DIPB	Input	4	Port A/B parity input bus.
ADDRA, ADDRB	Input	14	Port A/B address input bus. MSB always exists on ADDRA/B while the LSB is determined by the settings for DATA_WIDTH_A/B.
WEA, WEB	Input	4	Port A/B byte-wide write enable.
ENA, ENB	Input	1	Port A/B enable
SSRA, SSRB	Input	1	Port A/B output registers synchronous reset.
CLKA, CLKB	Input	1	Port A/B clock input.

Design Entry Method

This design element can be used in schematics.

This element can be inferred by most synthesis tools by properly describing the RAM behavior in standard RTL code (consult synthesis tool documentation for details). Alternatively, CORE Generator™ can also create the desired macro for this RAM. If it is desired to have more control over the implementation or placement of this component, it may also be directly instantiated. To instantiate this component, use the HDL templates in the ISE® software or the instantiation template below and paste into your code. Connect all necessary inputs to the desired signals in the design. The CLKA/CLKB clock signals must be tied to an active clock for RAM operation and the SSRA/SSRB reset signals must be either tied to a logic zero or to the proper reset signal. ENA/ENB must either be tied to a logic one or a proper RAM port enable signal. Refer to the DATA_WIDTH table below for the necessary data input, data output, write enable and address connection information for each DATA_WIDTH setting as the necessary connections for these signals change based on this attribute. All other output signals can be left unconnected (open) and all unused input signals should be tied to a logic zero.

The following table shows the necessary input and output connections for the variable input ports for each DATA_WIDTH values for either Port A or Port B:

DATA_WIDTH Value	DI, DIP Connections	ADDR Connections	WE Connections	DO, DOP Connections
1	DI[0]	ADDR[13:0]	Connect WE[3:0] to single user WE signal	DO[0]
2	DI[1:0]	ADDR[13:1]	Connect WE[3:0] to single user WE signal	DO[1:0]
4	DI[3:0]	ADDR[13:2]	Connect WE[3:0] to single user WE signal	DO[3:0]
9	DI[7:0], DIP[0]	ADDR[13:3]	Connect WE[3:0] to single user WE signal	DO[7:0], DOP[0]
18	DI[15:0], DIP[1:0]	ADDR[13:4]	Connect WE[0] and WE[2] to user WE[0] and WE[1] and WE[3] to user WE[1]	DO[15:0], DOP[1:0]
36	DI[31:0], DIP[3:0]	ADDR[13:5]	Connect each WE[3:0] signal to the associated byte write enable.	DO[31:0], DOP[3:0]

Alternatively, the prior RAMB16_Sm_Sn design elements can be instantiated if a byte-enable operation is not necessary. Also, new convenience macros called RAMB16BWE_Sm_Sn are provided to allow for easier instantiation of this RAM with byte-enable operation. If either of these components is used, the software automatically re-targets it to a properly configured RAMB16BWE component.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
DATA_WIDTH_A, DATA_WIDTH_B	Integer	0, 1, 2, 4, 9, 18, or 36	0	Specifies the configurable data width for Ports A and B.
INIT_A, INIT_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the initial value on the Port B output after configuration.
SIM_COLLISION_CHECK	String	ALL, "WARNING_ONLY", "GENERATE_X_ONLY" or "NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A, SRVAL_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the output value of Port B upon the assertion of the synchronous reset (SSRB) signal.
WRITE_MODE_A, WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", or "NO_CHANGE	"WRITE_FIRST	Specifies output behavior of the port being written to: • WRITE_FIRST" = written value appears on output port of the RAM. • READ_FIRST = previous RAM contents for that memory location appear on the output port. • NO_CHANGE = previous value on the output port remains the same.
INIT_00 to INIT_3F	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 16kb data memory array.
INITP_00 to INITP_07	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 2kb parity data memory array.

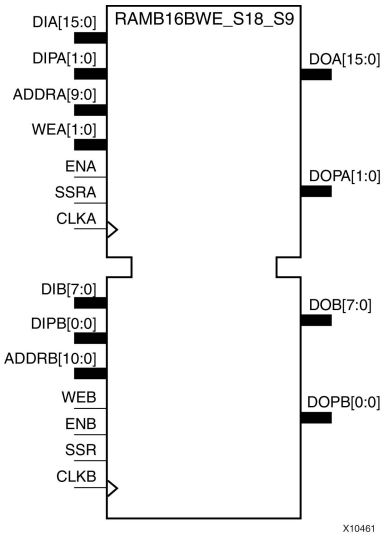
- See the *Spartan-3A FPGA Family Data Sheet*.

RAMB16BWE_S18_S9

Primitive: 16K-bit Data and 2K-bit Parity Synchronous Dual Port Block RAM with 18-bit and 9-bit Ports



Introduction

This design element can be configured and used as a 1-bit wide by 16K deep to a 36-bit wide by 512 deep single-port or dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, Port A and Port B may operate fully independently and asynchronously to each other accessing the same memory array. When configured in the wider data width modes, byte-enable write operations are possible. This block RAM memory offers fast and flexible storage of large amounts of on-chip data.

Port Descriptions

Port	Direction	Width	Function
DOA, DOB	Output	32	Port A/B data output bus.
DOPA, DOPB	Output	4	Port A/B parity output bus.
DIA, DIB	Input	32	Port A/B data input bus.
DIPA, DIPB	Input	4	Port A/B parity input bus.
ADDRA, ADDRB	Input	14	Port A/B address input bus. MSB always exists on ADDRA/B while the LSB is determined by the settings for DATA_WIDTH_A/B.
WEA, WEB	Input	4	Port A/B byte-wide write enable.
ENA, ENB	Input	1	Port A/B enable
SSRA, SSRB	Input	1	Port A/B output registers synchronous reset.
CLKA, CLKB	Input	1	Port A/B clock input.

Design Entry Method

This design element can be used in schematics.

This element can be inferred by most synthesis tools by properly describing the RAM behavior in standard RTL code (consult synthesis tool documentation for details). Alternatively, CORE Generator™ can also create the desired macro for this RAM. If it is desired to have more control over the implementation or placement of this component, it may also be directly instantiated. To instantiate this component, use the HDL templates in the ISE® software or the instantiation template below and paste into your code. Connect all necessary inputs to the desired signals in the design. The CLKA/CLKB clock signals must be tied to an active clock for RAM operation and the SSRA/SSRB reset signals must be either tied to a logic zero or to the proper reset signal. ENA/ENB must either be tied to a logic one or a proper RAM port enable signal. Refer to the DATA_WIDTH table below for the necessary data input, data output, write enable and address connection information for each DATA_WIDTH setting as the necessary connections for these signals change based on this attribute. All other output signals can be left unconnected (open) and all unused input signals should be tied to a logic zero.

The following table shows the necessary input and output connections for the variable input ports for each DATA_WIDTH values for either Port A or Port B:

DATA_WIDTH Value	DI, DIP Connections	ADDR Connections	WE Connections	DO, DOP Connections
1	DI[0]	ADDR[13:0]	Connect WE[3:0] to single user WE signal	DO[0]
2	DI[1:0]	ADDR[13:1]	Connect WE[3:0] to single user WE signal	DO[1:0]
4	DI[3:0]	ADDR[13:2]	Connect WE[3:0] to single user WE signal	DO[3:0]
9	DI[7:0], DIP[0]	ADDR[13:3]	Connect WE[3:0] to single user WE signal	DO[7:0], DOP[0]
18	DI[15:0], DIP[1:0]	ADDR[13:4]	Connect WE[0] and WE[2] to user WE[0] and WE[1] and WE[3] to user WE[1]	DO[15:0], DOP[1:0]
36	DI[31:0], DIP[3:0]	ADDR[13:5]	Connect each WE[3:0] signal to the associated byte write enable.	DO[31:0], DOP[3:0]

Alternatively, the prior RAMB16_Sm_Sn design elements can be instantiated if a byte-enable operation is not necessary. Also, new convenience macros called RAMB16BWE_Sm_Sn are provided to allow for easier instantiation of this RAM with byte-enable operation. If either of these components is used, the software automatically re-targets it to a properly configured RAMB16BWE component.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
DATA_WIDTH_A, DATA_WIDTH_B	Integer	0, 1, 2, 4, 9, 18, or 36	0	Specifies the configurable data width for Ports A and B.
INIT_A, INIT_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the initial value on the Port B output after configuration.
SIM_COLLISION_CHECK	String	ALL, "WARNING_ONLY", "GENERATE_X_ONLY" or "NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value.

Attribute	Type	Allowed Values	Default	Description
				• "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A, SRVAL_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the output value of Port B upon the assertion of the synchronous reset (SSRB) signal.
WRITE_MODE_A, WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", or "NO_CHANGE	"WRITE_ FIRST	Specifies output behavior of the port being written to: • WRITE_FIRST" = written value appears on output port of the RAM. • READ_FIRST = previous RAM contents for that memory location appear on the output port. • NO_CHANGE = previous value on the output port remains the same.
INIT_00 to INIT_3F	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 16kb data memory array.
INITP_00 to INITP_07	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 2kb parity data memory array.

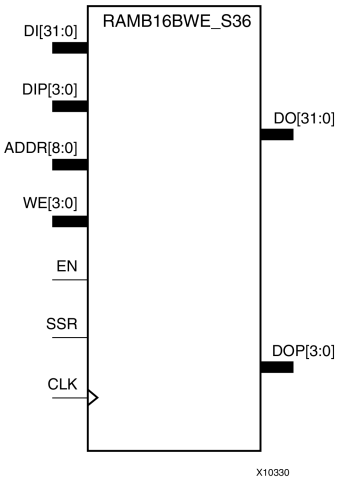
RAMB16BWE_S36

Primitive: 16K-bit Data and 2K-bit Parity Synchronous Single Port Block RAM with 36-Bit Port



Introduction

This design element can be configured and used as a 1-bit wide by 16K deep to a 36-bit wide by 512 deep single-port or dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, Port A and Port B may operate fully independently and asynchronously to each other accessing the same memory array. When configured in the wider data width modes, byte-enable write operations are possible. This block RAM memory offers fast and flexible storage of large amounts of on-chip data.

Port Descriptions

Port	Direction	Width	Function
DOA, DOB	Output	32	Port A/B data output bus.
DOPA, DOPB	Output	4	Port A/B parity output bus.
DIA, DIB	Input	32	Port A/B data input bus.
DIPA, DIPB	Input	4	Port A/B parity input bus.
ADDRA, ADDRB	Input	14	Port A/B address input bus. MSB always exists on ADDRA/B while the LSB is determined by the settings for DATA_WIDTH_A/B.
WEA, WEB	Input	4	Port A/B byte-wide write enable.
ENA, ENB	Input	1	Port A/B enable
SSRA, SSRB	Input	1	Port A/B output registers synchronous reset.
CLKA, CLKB	Input	1	Port A/B clock input.

Design Entry Method

This design element can be used in schematics.

This element can be inferred by most synthesis tools by properly describing the RAM behavior in standard RTL code (consult synthesis tool documentation for details). Alternatively, CORE Generator™ can also create the desired macro for this RAM. If it is desired to have more control over the implementation or placement of this component, it may also be directly instantiated. To instantiate this component, use the HDL templates in the ISE® software or the instantiation template below and paste into your code. Connect all necessary inputs to the desired signals in the design. The CLKA/CLKB clock signals must be tied to an active clock for RAM operation and the SSRA/SSRB reset signals must be either tied to a logic zero or to the proper reset signal. ENA/ENB must either be tied to a logic one or a proper RAM port enable signal. Refer to the DATA_WIDTH table below for the necessary data input, data output, write enable and address connection information for each DATA_WIDTH setting as the necessary connections for these signals change based on this attribute. All other output signals can be left unconnected (open) and all unused input signals should be tied to a logic zero.

The following table shows the necessary input and output connections for the variable input ports for each DATA_WIDTH values for either Port A or Port B:

DATA_WIDTH Value	DI, DIP Connections	ADDR Connections	WE Connections	DO, DOP Connections
1	DI[0]	ADDR[13:0]	Connect WE[3:0] to single user WE signal	DO[0]
2	DI[1:0]	ADDR[13:1]	Connect WE[3:0] to single user WE signal	DO[1:0]
4	DI[3:0]	ADDR[13:2]	Connect WE[3:0] to single user WE signal	DO[3:0]
9	DI[7:0], DIP[0]	ADDR[13:3]	Connect WE[3:0] to single user WE signal	DO[7:0], DOP[0]
18	DI[15:0], DIP[1:0]	ADDR[13:4]	Connect WE[0] and WE[2] to user WE[0] and WE[1] and WE[3] to user WE[1]	DO[15:0], DOP[1:0]
36	DI[31:0], DIP[3:0]	ADDR[13:5]	Connect each WE[3:0] signal to the associated byte write enable.	DO[31:0], DOP[3:0]

Alternatively, the prior RAMB16_Sm_Sn design elements can be instantiated if a byte-enable operation is not necessary. Also, new convenience macros called RAMB16BWE_Sm_Sn are provided to allow for easier instantiation of this RAM with byte-enable operation. If either of these components is used, the software automatically re-targets it to a properly configured RAMB16BWE component.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
DATA_WIDTH_A, DATA_WIDTH_B	Integer	0, 1, 2, 4, 9, 18, or 36	0	Specifies the configurable data width for Ports A and B.
INIT_A, INIT_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the initial value on the Port B output after configuration.
SIM_COLLISION_CHECK	String	ALL, "WARNING_ONLY", "GENERATE_X_ONLY" or "NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value.

Attribute	Type	Allowed Values	Default	Description
				• "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A, SRVAL_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the output value of Port B upon the assertion of the synchronous reset (SSRB) signal.
WRITE_MODE_A, WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", or "NO_CHANGE	"WRITE_ FIRST	Specifies output behavior of the port being written to: • WRITE_FIRST" = written value appears on output port of the RAM. • READ_FIRST = previous RAM contents for that memory location appear on the output port. • NO_CHANGE = previous value on the output port remains the same.
INIT_00 to INIT_3F	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 16kb data memory array.
INITP_00 to INITP_07	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 2kb parity data memory array.

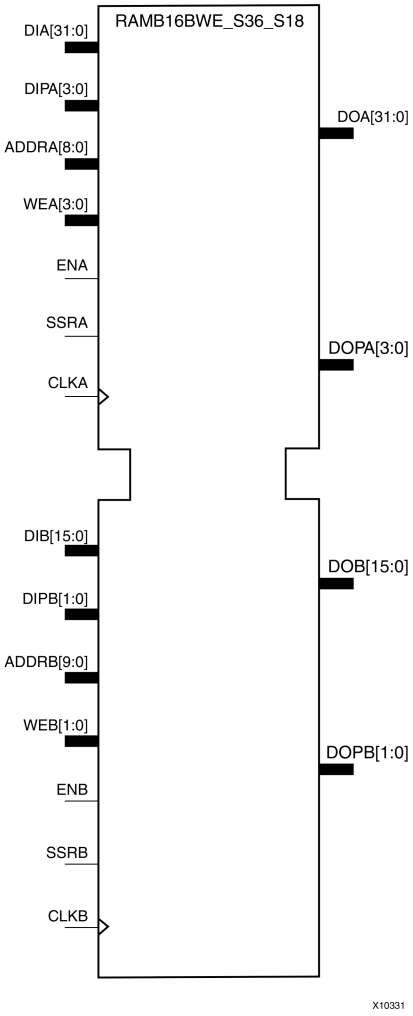
RAMB16BWE_S36_S18

Primitive: 16K-bit Data and 2K-bit Parity Synchronous Dual Port Block RAM with 36-bit and 18-bit Ports



Introduction

This design element can be configured and used as a 1-bit wide by 16K deep to a 36-bit wide by 512 deep single-port or dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, Port A and Port B may operate fully independently and asynchronously to each other accessing the same memory array. When configured in the wider data width modes, byte-enable write operations are possible. This block RAM memory offers fast and flexible storage of large amounts of on-chip data.

Port Descriptions

Port	Direction	Width	Function
DOA, DOB	Output	32	Port A/B data output bus.
DOPA, DOPB	Output	4	Port A/B parity output bus.
DIA, DIB	Input	32	Port A/B data input bus.
DIPA, DIPB	Input	4	Port A/B parity input bus.
ADDRA, ADDRB	Input	14	Port A/B address input bus. MSB always exists on ADDRA/B while the LSB is determined by the settings for DATA_WIDTH_A/B.
WEA, WEB	Input	4	Port A/B byte-wide write enable.
ENA, ENB	Input	1	Port A/B enable
SSRA, SSRB	Input	1	Port A/B output registers synchronous reset.
CLKA, CLKB	Input	1	Port A/B clock input.

Design Entry Method

This design element can be used in schematics.

This element can be inferred by most synthesis tools by properly describing the RAM behavior in standard RTL code (consult synthesis tool documentation for details). Alternatively, CORE Generator™ can also create the desired macro for this RAM. If it is desired to have more control over the implementation or placement of this component, it may also be directly instantiated. To instantiate this component, use the HDL templates in the ISE® software or the instantiation template below and paste into your code. Connect all necessary inputs to the desired signals in the design. The CLKA/CLKB clock signals must be tied to an active clock for RAM operation and the SSRA/SSRB reset signals must be either tied to a logic zero or to the proper reset signal. ENA/ENB must either be tied to a logic one or a proper RAM port enable signal. Refer to the DATA_WIDTH table below for the necessary data input, data output, write enable and address connection information for each DATA_WIDTH setting as the necessary connections for these signals change based on this attribute. All other output signals can be left unconnected (open) and all unused input signals should be tied to a logic zero.

The following table shows the necessary input and output connections for the variable input ports for each DATA_WIDTH values for either Port A or Port B:

DATA_WIDTH Value	DI, DIP Connections	ADDR Connections	WE Connections	DO, DOP Connections
1	DI[0]	ADDR[13:0]	Connect WE[3:0] to single user WE signal	DO[0]
2	DI[1:0]	ADDR[13:1]	Connect WE[3:0] to single user WE signal	DO[1:0]
4	DI[3:0]	ADDR[13:2]	Connect WE[3:0] to single user WE signal	DO[3:0]
9	DI[7:0], DIP[0]	ADDR[13:3]	Connect WE[3:0] to single user WE signal	DO[7:0], DOP[0]
18	DI[15:0], DIP[1:0]	ADDR[13:4]	Connect WE[0] and WE[2] to user WE[0] and WE[1] and WE[3] to user WE[1]	DO[15:0], DOP[1:0]
36	DI[31:0], DIP[3:0]	ADDR[13:5]	Connect each WE[3:0] signal to the associated byte write enable.	DO[31:0], DOP[3:0]

Alternatively, the prior RAMB16_Sm_Sn design elements can be instantiated if a byte-enable operation is not necessary. Also, new convenience macros called RAMB16BWE_Sm_Sn are provided to allow for easier instantiation of this RAM with byte-enable operation. If either of these components is used, the software automatically re-targets it to a properly configured RAMB16BWE component.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
DATA_WIDTH_A, DATA_WIDTH_B	Integer	0, 1, 2, 4, 9, 18, or 36	0	Specifies the configurable data width for Ports A and B.
INIT_A, INIT_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the initial value on the Port B output after configuration.
SIM_COLLISION_CHECK	String	ALL, "WARNING_ONLY", "GENERATE_X_ONLY" or "NONE	"ALL	Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. **Note** Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the *Synthesis and Simulation Design Guide* for more information.
SRVAL_A, SRVAL_B	Hexadecimal	Any 36-Bit Value	All zeros	Specifies the output value of Port B upon the assertion of the synchronous reset (SSRB) signal.
WRITE_MODE_A, WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", or "NO_CHANGE	"WRITE_FIRST	Specifies output behavior of the port being written to: • WRITE_FIRST" = written value appears on output port of the RAM. • READ_FIRST = previous RAM contents for that memory location appear on the output port. • NO_CHANGE = previous value on the output port remains the same.
INIT_00 to INIT_3F	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 16kb data memory array.
INITP_00 to INITP_07	Hexadecimal	Any 256-Bit Value	All zeros	Allows specification of the initial contents of the 2kb parity data memory array.

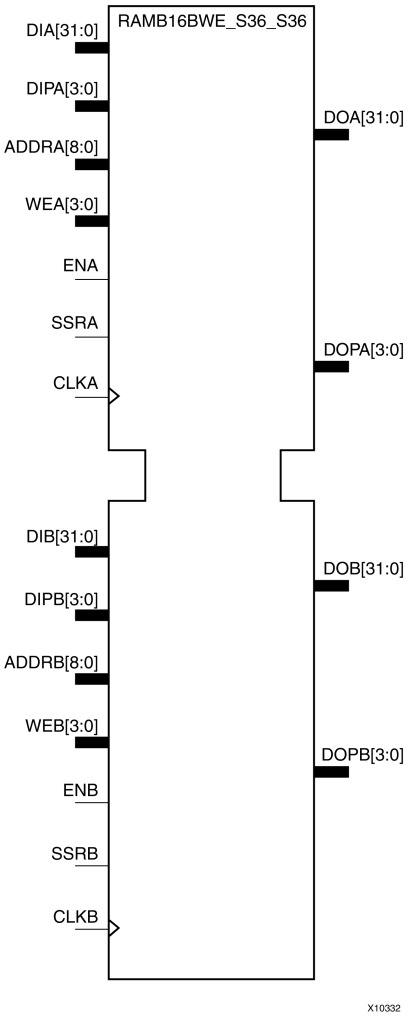
RAMB16BWE_S36_S36

Primitive: 16K-bit Data and 2K-bit Parity Synchronous Dual Port Block RAM with 36-bit Ports



Introduction

This design element can be configured and used as a 1-bit wide by 16K deep to a 36-bit wide by 512 deep single-port or dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, Port A and Port B may operate fully independently and asynchronously to each other accessing the same memory array. When configured in the wider data width modes, byte-enable write operations are possible. This block RAM memory offers fast and flexible storage of large amounts of on-chip data.

Port Descriptions

Port	Direction	Width	Function
DOA, DOB	Output	32	Port A/B data output bus.
DOPA, DOPB	Output	4	Port A/B parity output bus.
DIA, DIB	Input	32	Port A/B data input bus.
DIPA, DIPB	Input	4	Port A/B parity input bus.
ADDRA, ADDRB	Input	14	Port A/B address input bus. MSB always exists on ADDRA/B while the LSB is determined by the settings for DATA_WIDTH_A/B.
WEA, WEB	Input	4	Port A/B byte-wide write enable.
ENA, ENB	Input	1	Port A/B enable
SSRA, SSRB	Input	1	Port A/B output registers synchronous reset.
CLKA, CLKB	Input	1	Port A/B clock input.

Design Entry Method

This design element can be used in schematics.

This element can be inferred by most synthesis tools by properly describing the RAM behavior in standard RTL code (consult synthesis tool documentation for details). Alternatively, CORE Generator™ can also create the desired macro for this RAM. If it is desired to have more control over the implementation or placement of this component, it may also be directly instantiated. To instantiate this component, use the HDL templates in the ISE® software or the instantiation template below and paste into your code. Connect all necessary inputs to the desired signals in the design. The CLKA/CLKB clock signals must be tied to an active clock for RAM operation and the SSRA/SSRB reset signals must be either tied to a logic zero or to the proper reset signal. ENA/ENB must either be tied to a logic one or a proper RAM port enable signal. Refer to the DATA_WIDTH table below for the necessary data input, data output, write enable and address connection information for each DATA_WIDTH setting as the necessary connections for these signals change based on this attribute. All other output signals can be left unconnected (open) and all unused input signals should be tied to a logic zero.

The following table shows the necessary input and output connections for the variable input ports for each DATA_WIDTH values for either Port A or Port B:

DATA_WIDTH Value	DI, DIP Connections	ADDR Connections	WE Connections	DO, DOP Connections
1	DI[0]	ADDR[13:0]	Connect WE[3:0] to single user WE signal	DO[0]
2	DI[1:0]	ADDR[13:1]	Connect WE[3:0] to single user WE signal	DO[1:0]
4	DI[3:0]	ADDR[13:2]	Connect WE[3:0] to single user WE signal	DO[3:0]
9	DI[7:0], DIP[0]	ADDR[13:3]	Connect WE[3:0] to single user WE signal	DO[7:0], DOP[0]
18	DI[15:0], DIP[1:0]	ADDR[13:4]	Connect WE[0] and WE[2] to user WE[0] and WE[1] and WE[3] to user WE[1]	DO[15:0], DOP[1:0]
36	DI[31:0], DIP[3:0]	ADDR[13:5]	Connect each WE[3:0] signal to the associated byte write enable.	DO[31:0], DOP[3:0]

Alternatively, the prior RAMB16_Sm_Sn design elements can be instantiated if a byte-enable operation is not necessary. Also, new convenience macros called RAMB16BWE_Sm_Sn are provided to allow for easier instantiation of this RAM with byte-enable operation. If either of these components is used, the software automatically re-targets it to a properly configured RAMB16BWE component.

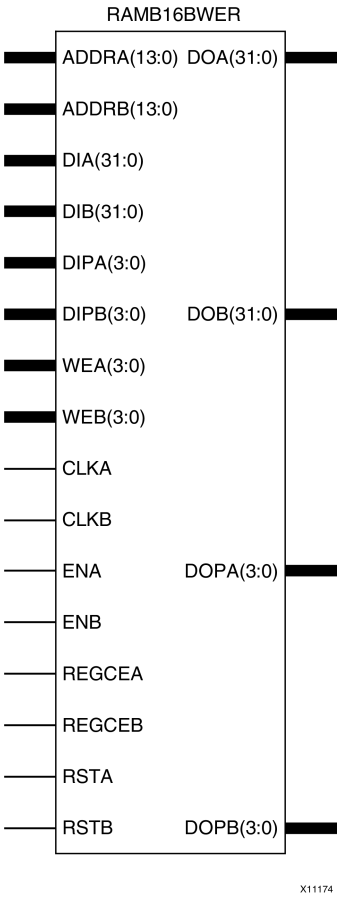
RAMB16BWER

Primitive: 16K-bit Data and 2K-bit Parity Configurable Synchronous Dual Port Block RAM with Optional Output Registers



Introduction

This design element contains several block RAM memories that can be configured as general-purpose 16kb data + 2kb parity RAM/ROM memories. These block RAM memories offer fast and flexible storage of large amounts of on-chip data. This component can be configured and used as a 1-bit wide by 16K deep to a 36-bit wide by 512 deep, single-port or dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, Port A and Port B can operate fully independently and asynchronously to each other, accessing the same memory array. When these ports are configured in the wider data width modes, byte-enable write operations are possible. This RAM also offers a configurable output register that can be enabled to improve clock-to-out times of the RAM while incurring an extra clock cycle of latency during the read operation.

Port Descriptions

The following table shows the necessary input and output connections for the variable input ports for each DATA_WIDTH value for either Port A or Port B.

DATA_WIDTH Value	DI, DIP Connections	ADDR Connections	WE Connections
1	DI[0]	ADDR[13:0]	Connect WE[3:0] to single user WE signal.
2	DI[1:0]	ADDR[13:1]	Connect WE[3:0] to single user WE signal.
4	DI[3:0]	ADDR[13:2]	Connect WE[3:0] to single user WE signal.
9	DI[7:0], DIP[0]	ADDR[13:3]	Connect WE[3:0] to single user WE signal.
18	DI[15:0], DIP[1:0]	ADDR[13:4]	Connect WE[0] and WE[2] to user WE[0] and WE[1] and WE[3] to user WE[1].
36	DI[31:0], DIP[3:0]	ADDR[13:5]	Connect each WE[3:0] signal to the associated byte write enable.

Alternatively, the older RAMB16_Sm_Sn and RAMB16BWER_Sm_Sn elements can be instantiated if the output registers are not necessary. If any of these components are used, the software will automatically retarget them to a properly configured RAMB16BWER element.

Port	Direction	Width	Function
ADDRA[13:0]	Input	14	Port A address input bus. MSB always exists on ADDRA[13] while the LSB is determined by the settings for DATA_WIDTH_A.
ADDRB[13:0]	Input	14	Port B address input bus. MSB always exists on ADDRB[13] while the LSB is determined by the settings for DATA_WIDTH_B.
CLKA	Input	1	Port A clock input.
CLKB	Input	1	Port B clock input.
DIA[31:0]	Input	32	Port A data input bus.
DIB[31:0]	Input	32	Port B data input bus.
DIPA[3:0]	Input	4	Port A parity input bus.
DIPB[3:0]	Input	4	Port B parity input bus.
DOA[31:0]	Output	32	Port A data output bus.
DOB[31:0]	Output	32	Port B data output bus.
DOPA[3:0]	Output	4	Port A parity output bus.
DOPB[3:0]	Output	4	Port B parity output bus.
ENA	Input	1	Port A enable.
ENB	Input	1	Port B enable.
REGCEA	Input	1	Output register clock enable.
REGCEB	Input	1	Output register clock enable.
RSTA	Input	1	Port A output registers set/reset. This reset is configurable to be synchronous or asynchronous, depending on the value of the RSTTYPE attribute.
RSTB	Input	1	Port B output registers set/reset. This reset is configurable to be synchronous or asynchronous, depending on the value of the RSTTYPE attribute.
WEA[3:0]	Input	4	Port A byte-wide write enable.
WEB[3:0]	Input	4	Port B byte-wide write enable.

Design Entry Method

This design element can be used in schematics.

Connect all necessary inputs to the desired signals in the design. The CLKA/CLKB clock signals must be tied to an active clock for RAM operation, and the SRA/SRB reset signals must be either tied to a logic zero or to the proper reset signal. ENA/ENB must either be tied to a logic one or a proper RAM port enable signal. REGCEA and REGCEB must be tied to the proper output register clock enable, or a logic one if the respective DOA_REG or DOB_REG attribute is set to 1. If DOA_REG is set to 0, then REGCEA and REGCEB must be set to a logic 0.

Refer to the DATA_WIDTH column in the "Port Description" table (above) for the necessary data input, data output, write enable and address connection information for each DATA_WIDTH setting, since the necessary connections for these signals change, based on this attribute. All other output signals can be left unconnected (open) and all unused input signals should be tied to a logic zero.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
DATA_WIDTH_A	Integer	0, 1, 2, 4, 9, 18, 36	0	Specifies the configurable data width for port A. Need not equal the width for port B.
DATA_WIDTH_B	Integer	0, 1, 2, 4, 9, 18, 36	0	Specifies the configurable data width for port B. Need not equal the width for port A.
DOA_REG	Integer	0, 1	0	Set to 1 to use the A port output registers.
DOB_REG	Integer	0, 1	0	Set to 1 to use the B port output registers.
INIT_A	Hexa-decimal	36'h000000000 to 36'hfffffffff	All zeros	Specifies the initial value on the port A output after configuration.
INIT_B	Hexa-decimal	36'h000000000 to 36'hfffffffff	All zeros	Specifies the initial value on the Port B output after configuration.
INIT_FILE	String	0 bit String	NONE	File name of file used to specify initial RAM contents.
INIT_00 to INIT_3F	Hexa-decimal	Any 256 bit value	All zeros	Specifies the initial contents of the 16 kb data memory array.
INITP_01 to INITP_07	Hexa-decimal	Any 256 bit value	All zeros	Specifies the initial contents of the 2 kb parity data memory array.
RSTTYPE	String	"SYNC", "ASYNC"	"SYNC"	Selects whether the RAM outputs should have a synchronous or asynchronous reset capability. Due to improved timing and circuit stability, it is recommended to always have this set to "SYNC" unless an asynchronous reset is absolutely necessary.
SIM_COLLISION_CHECK	String	"ALL", "GENERATE_X_ONLY", "WARNING_ONLY", "NONE"	"ALL"	Allows modification of the simulation behavior so that if a memory collision occurs: • ALL - Warning produced and affected outputs/memory go unknown (X). • WARNING_ONLY - Warning produced and affected outputs/memory retain last value. • GENERATE_X_ONLY - No warning, but affected outputs/memory go unknown (X). • NONE - No warning and affected outputs/memory retain last value.

Attribute	Type	Allowed Values	Default	Description
				Note Setting this to a value other than "ALL" can allow problems in the design to go unnoticed during simulation. Care should be taken when changing the value of this attribute.
SRVAL_A	Hexa-decimal	36'h000000000 to 36'hfffffffff	All zeros	Specifies the output value of Port A upon the assertion of the reset (RSTA) signal.
SRVAL_B	Hexa-decimal	36'h000000000 to 36'hfffffffff	All zeros	Specifies the output value of Port B upon the assertion of the reset (RSTB) signal.
WRITE_MODE_A	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE"	"WRITE_FIRST"	Specifies output behavior of the port being written to: • WRITE_FIRST - Written value appears on output port of the RAM. • READ_FIRST - Previous RAM contents for that memory location appear on the output port. • NO_CHANGE - Previous value on the output port remains the same.
WRITE_MODE_B	String	"WRITE_FIRST", "READ_FIRST", "NO_CHANGE"	"WRITE_FIRST"	Specifies output behavior of the port being written to: • WRITE_FIRST - Written value appears on output port of the RAM. • READ_FIRST - Previous RAM contents for that memory location appear on the output port. • NO_CHANGE - Previous value on the output port remains the same.

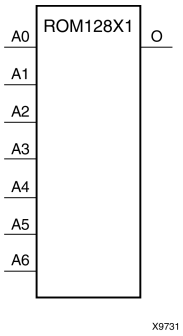
ROM128X1

Primitive: 128-Deep by 1-Wide ROM



Introduction

This design element is a 128-word by 1-bit read-only memory. The data output (O) reflects the word selected by the 7-bit address (A6:A0). The ROM is initialized to a known value during configuration with the INIT=value parameter. The value consists of 32 hexadecimal digits that are written into the ROM from the most-significant digit A=FH to the least-significant digit A=0H. An error occurs if the INIT=value is not specified.

Logic Table

Input				Output
I0	**I1**	**I2**	**I3**	**O**
0	0	0	0	INIT(0)
0	0	0	1	INIT(1)
0	0	1	0	INIT(2)
0	0	1	1	INIT(3)
0	1	0	0	INIT(4)
0	1	0	1	INIT(5)
0	1	1	0	INIT(6)
0	1	1	1	INIT(7)
1	0	0	0	INIT(8)
1	0	0	1	INIT(9)
1	0	1	0	INIT(10)
1	0	1	1	INIT(11)
1	1	0	0	INIT(12)
1	1	0	1	INIT(13)
1	1	1	0	INIT(14)
1	1	1	1	INIT(15)

Design Entry Method

This design element can be used in schematics.

Available Attributes

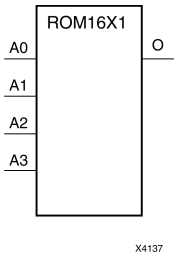
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 128-Bit Value	All zeros	Specifies the contents of the ROM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ROM16X1

Primitive: 16-Deep by 1-Wide ROM



Introduction

This design element is a 16-word by 1-bit read-only memory. The data output (O) reflects the word selected by the 4-bit address (A3:A0). The ROM is initialized to a known value during configuration with the INIT=value parameter. The value consists of four hexadecimal digits that are written into the ROM from the most-significant digit A=FH to the least-significant digit A=0H. For example, the INIT=10A7 parameter produces the data stream: 0001 0000 1010 0111 An error occurs if the INIT=value is not specified.

Logic Table

Input				Output
I0	**I1**	**I2**	**I3**	**O**
0	0	0	0	INIT(0)
0	0	0	1	INIT(1)
0	0	1	0	INIT(2)
0	0	1	1	INIT(3)
0	1	0	0	INIT(4)
0	1	0	1	INIT(5)
0	1	1	0	INIT(6)
0	1	1	1	INIT(7)
1	0	0	0	INIT(8)
1	0	0	1	INIT(9)
1	0	1	0	INIT(10)
1	0	1	1	INIT(11)
1	1	0	0	INIT(12)
1	1	0	1	INIT(13)
1	1	1	0	INIT(14)
1	1	1	1	INIT(15)

Design Entry Method

This design element can be used in schematics.

Available Attributes

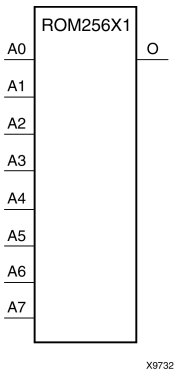
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 16-Bit Value	All zeros	Specifies the contents of the ROM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ROM256X1

Primitive: 256-Deep by 1-Wide ROM



Introduction

This design element is a 256-word by 1-bit read-only memory. The data output (O) reflects the word selected by the 8-bit address (A7:A0). The ROM is initialized to a known value during configuration with the INIT=value parameter. The value consists of 64 hexadecimal digits that are written into the ROM from the most-significant digit A=FH to the least-significant digit A=0H.

An error occurs if the INIT=value is not specified.

Logic Table

Input				Output
I0	**I1**	**I2**	**I3**	**O**
0	0	0	0	INIT(0)
0	0	0	1	INIT(1)
0	0	1	0	INIT(2)
0	0	1	1	INIT(3)
0	1	0	0	INIT(4)
0	1	0	1	INIT(5)
0	1	1	0	INIT(6)
0	1	1	1	INIT(7)
1	0	0	0	INIT(8)
1	0	0	1	INIT(9)
1	0	1	0	INIT(10)
1	0	1	1	INIT(11)
1	1	0	0	INIT(12)
1	1	0	1	INIT(13)
1	1	1	0	INIT(14)
1	1	1	1	INIT(15)

Design Entry Method

This design element can be used in schematics.

Available Attributes

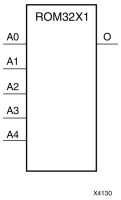
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 256-Bit Value	All zeros	Specifies the contents of the ROM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ROM32X1

Primitive: 32-Deep by 1-Wide ROM



Introduction

This design element is a 32-word by 1-bit read-only memory. The data output (O) reflects the word selected by the 5-bit address (A4:A0). The ROM is initialized to a known value during configuration with the INIT=value parameter. The value consists of eight hexadecimal digits that are written into the ROM from the most-significant digit A=1FH to the least-significant digit A=00H.

For example, the INIT=10A78F39 parameter produces the data stream: 0001 0000 1010 0111 1000 1111 0011 1001. An error occurs if the INIT=value is not specified.

Logic Table

Input				Output
I0	**I1**	**I2**	**I3**	**O**
0	0	0	0	INIT(0)
0	0	0	1	INIT(1)
0	0	1	0	INIT(2)
0	0	1	1	INIT(3)
0	1	0	0	INIT(4)
0	1	0	1	INIT(5)
0	1	1	0	INIT(6)
0	1	1	1	INIT(7)
1	0	0	0	INIT(8)
1	0	0	1	INIT(9)
1	0	1	0	INIT(10)
1	0	1	1	INIT(11)
1	1	0	0	INIT(12)
1	1	0	1	INIT(13)
1	1	1	0	INIT(14)
1	1	1	1	INIT(15)

Design Entry Method

This design element can be used in schematics.

Available Attributes

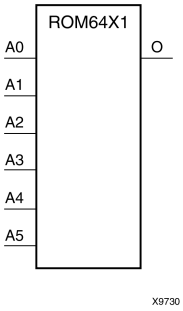
Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 32-Bit Value	All zeros	Specifies the contents of the ROM.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

ROM64X1

Primitive: 64-Deep by 1-Wide ROM



Introduction

This design element is a 64-word by 1-bit read-only memory. The data output (O) reflects the word selected by the 6-bit address (A5:A0). The ROM is initialized to a known value during configuration with the INIT=value parameter. The value consists of 16 hexadecimal digits that are written into the ROM from the most-significant digit A=FH to the least-significant digit A=0H. An error occurs if the INIT=value is not specified.

Logic Table

Input				Output
I0	**I1**	**I2**	**I3**	**O**
0	0	0	0	INIT(0)
0	0	0	1	INIT(1)
0	0	1	0	INIT(2)
0	0	1	1	INIT(3)
0	1	0	0	INIT(4)
0	1	0	1	INIT(5)
0	1	1	0	INIT(6)
0	1	1	1	INIT(7)
1	0	0	0	INIT(8)
1	0	0	1	INIT(9)
1	0	1	0	INIT(10)
1	0	1	1	INIT(11)
1	1	0	0	INIT(12)
1	1	0	1	INIT(13)
1	1	1	0	INIT(14)
1	1	1	1	INIT(15)

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 64-Bit Value	All zeros	Specifies the contents of the ROM.

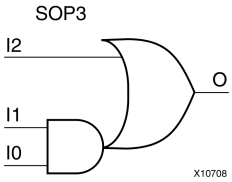
SOP3

Macro: 3–Input Sum of Products



Introduction

Three input Sum of Products (SOP) macros provide common logic functions by OR gating the output of one AND function with one direct input. Variations of inverting and non-inverting inputs are available.

Design Entry Method

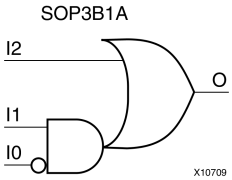
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

SOP3B1A

Macro: 3–Input Sum of Products with One Inverted Input (Option A)



Introduction

Three input Sum of Products (SOP) macros provide common logic functions by OR gating the output of one AND function with one direct input. Variations of inverting and non-inverting inputs are available.

Design Entry Method

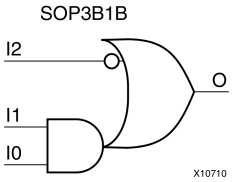
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

SOP3B1B

Macro: 3–Input Sum of Products with One Inverted Input (Option B)



Introduction

Three input Sum of Products (SOP) macros provide common logic functions by OR gating the output of one AND function with one direct input. Variations of inverting and non-inverting inputs are available.

Design Entry Method

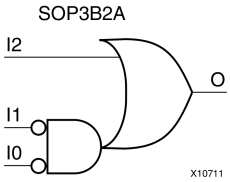
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

SOP3B2A

Macro: 3–Input Sum of Products with Two Inverted Inputs (Option A)



Introduction

Three input Sum of Products (SOP) macros provide common logic functions by OR gating the output of one AND function with one direct input. Variations of inverting and non-inverting inputs are available.

Design Entry Method

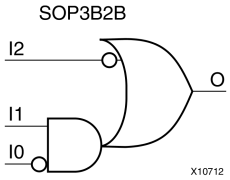
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

SOP3B2B

Macro: 3–Input Sum of Products with Two Inverted Inputs (Option B)



Introduction

Three input Sum of Products (SOP) macros provide common logic functions by OR gating the output of one AND function with one direct input. Variations of inverting and non-inverting inputs are available.

Design Entry Method

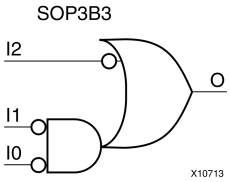
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

SOP3B3

Macro: 3–Input Sum of Products with Inverted Inputs



Introduction

Three input Sum of Products (SOP) macros provide common logic functions by OR gating the output of one AND function with one direct input. Variations of inverting and non-inverting inputs are available.

Design Entry Method

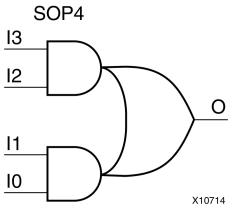
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

SOP4

Macro: 4–Input Sum of Products



Introduction

Four input Sum of Products (SOP) macros provide common logic functions by OR gating the outputs of two AND functions. Variations of inverting and non-inverting inputs are available.

Design Entry Method

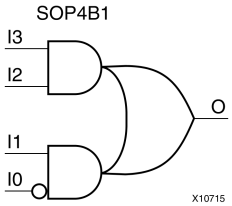
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

SOP4B1

Macro: 4–Input Sum of Products with One Inverted Input



Introduction

Four input Sum of Products (SOP) macros provide common logic functions by OR gating the outputs of two AND functions. Variations of inverting and non-inverting inputs are available.

Design Entry Method

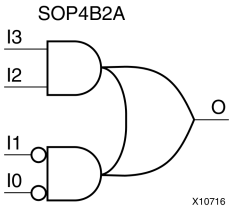
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

SOP4B2A

Macro: 4–Input Sum of Products with Two Inverted Inputs (Option A)



Introduction

Four input Sum of Products (SOP) macros provide common logic functions by OR gating the outputs of two AND functions. Variations of inverting and non-inverting inputs are available.

Design Entry Method

This design element is only for use in schematics.

For More Information

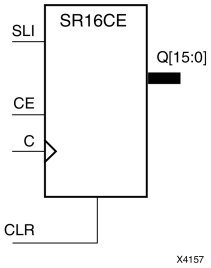
SR16CE

Macro: 16-Bit Serial-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear



Introduction

This design element is a shift register with a shift-left serial input (SLI), parallel outputs (Q), and clock enable (CE) and asynchronous clear (CLR) inputs. The (CLR) input, when High, overrides all other inputs and resets the data outputs (Q) Low. When (CE) is High and (CLR) is Low, the data on the SLI input is loaded into the first bit of the shift register during the Low-to- High clock (C) transition and appears on the (Q0) output. During subsequent Low-to- High clock transitions, when (CE) is High and (CLR) is Low, data shifts to the next highest bit position as new data is loaded into (Q0) (SLI→Q0, Q0→Q1, Q1→Q2, and so forth). The register ignores clock transitions when (CE) is Low.

Registers can be cascaded by connecting the last (Q) output of one stage to the SLI input of the next stage and connecting clock, (CE), and (CLR) in parallel.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				**Outputs**	
CLR	**CE**	**SLI**	**C**	**Q0**	**Qz : Q1**
1	X	X	X	0	0
0	0	X	X	No Change	No Change
0	1	SLI	↑	SLI	qn-1
z = bit width - 1 qn-1 = state of referenced output one setup time prior to active clock transition					

Design Entry Method

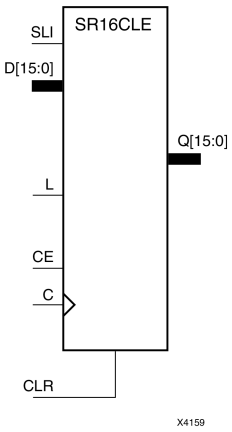
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

SR16CLE

Macro: 16-Bit Loadable Serial/Parallel-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear



Introduction

This design element is a shift register with a shift-left serial input (SLI), parallel inputs (D), parallel outputs (Q), and three control inputs: clock enable (CE), load enable (L), and asynchronous clear (CLR) . The register ignores clock transitions when (L) and (CE) are Low. The asynchronous (CLR), when High, overrides all other inputs and resets the data outputs (Q) Low. When (L) is High and (CLR) is Low, data on the Dn -D0 inputs is loaded into the corresponding Qn -(Q0) bits of the register.

When (CE) is High and (L) and (CLR) are Low, data on the SLI input is loaded into the first bit of the shift register during the Low-to-High clock (C) transition and appears on the (Q0) output. During subsequent clock transitions, when (CE) is High and (L) and (CLR) are Low, the data shifts to the next highest bit position as new data is loaded into (Q)0 (for example, SLI→Q0, Q0→Q1, and Q1→Q2).

Registers can be cascaded by connecting the last (Q) output of one stage to the SLI input of the next stage and connecting clock, (CE), (L), and (CLR) inputs in parallel.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs						Outputs	
CLR	**L**	**CE**	**SLI**	**Dn : D0**	**C**	**Q0**	**Qz : Q1**
1	X	X	X	X	X	0	0
0	1	X	X	Dn : D0	↑	D0	Dn
0	0	1	SLI	X	↑	SLI	qn-1
0	0	0	X	X	X	No Change	No Change
z = bitwidth -1 qn-1 = state of referenced output one setup time prior to active clock transition

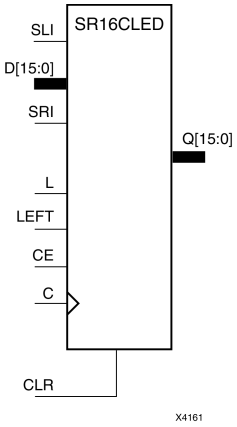
SR16CLED

Macro: 16-Bit Shift Register with Clock Enable and Asynchronous Clear



Introduction

This design element is a shift register with shift-left (SLI) and shift-right (SRI) serial inputs, parallel inputs (D), parallel outputs (Q), and four control inputs: clock enable (CE), load enable (L), shift left/right (LEFT), and asynchronous clear (CLR). The register ignores clock transitions when (CE) and (L) are Low. The asynchronous clear, when High, overrides all other inputs and resets the data outputs (Qn) Low.

When (L) is High and (CLR) is Low, the data on the (D) inputs is loaded into the corresponding (Q) bits of the register. When (CE) is High and (L) and (CLR) are Low, data is shifted right or left, depending on the state of the LEFT input. If LEFT is High, data on the SLI is loaded into (Q0) during the Low-to-High clock transition and shifted left (for example, to Q1 or Q2) during subsequent clock transitions. If LEFT is Low, data on the SRI is loaded into the last (Q) output during the Low-to-High clock transition and shifted right during subsequent clock transitions. The logic tables indicate the state of the (Q) outputs under all input conditions.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs								Outputs		
CLR	**L**	**CE**	**LEFT**	**SLI**	**SRI**	**D15 : D0**	**C**	**Q0**	**Q15**	**Q14 : Q1**
1	X	X	X	X	X	X	X	0	0	0
0	1	X	X	X	X	D15 : D0	↑	D0	D15	Dn
0	0	0	X	X	X	X	X	No Change	No Change	No Change
0	0	1	1	SLI	X	X	↑	SLI	q14	qn-1
0	0	1	0	X	SRI	X	↑	q1	SRI	qn+1
qn-1 or qn+1 = state of referenced output one setup time prior to active clock transition.										

Design Entry Method

This design element is only for use in schematics.

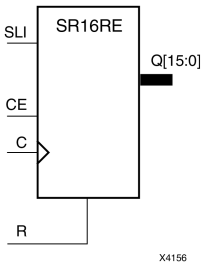
SR16RE

Macro: 16-Bit Serial-In Parallel-Out Shift Register with Clock Enable and Synchronous Reset



Introduction

This design element is a shift register with shift-left serial input (SLI), parallel outputs (Qn), clock enable (CE), and synchronous reset (R) inputs. The R input, when High, overrides all other inputs during the Low-to-High clock (C) transition and resets the data outputs (Q) Low.

When (CE) is High and (R) is Low, the data on the (SLI) is loaded into the first bit of the shift register during the Low-to-High clock (C) transition and appears on the (Q0) output. During subsequent Low-to-High clock transitions, when (CE) is High and R is Low, data shifts to the next highest bit position as new data is loaded into (Q0) (for example, SLI→Q0, Q0→Q1, and Q1→Q2). The register ignores clock transitions when (CE) is Low.

Registers can be cascaded by connecting the last (Q) output of one stage to the SLI input of the next stage and connecting clock, (CE), and (R) in parallel.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				Outputs	
R	**CE**	**SLI**	**C**	**Q0**	**Qz : Q1**
1	X	X	↑	0	0
0	0	X	X	No Change	No Change
0	1	SLI	↑	SLI	qn-1
z = bitwidth -1 qn-1 = state of referenced output one setup time prior to active clock transition

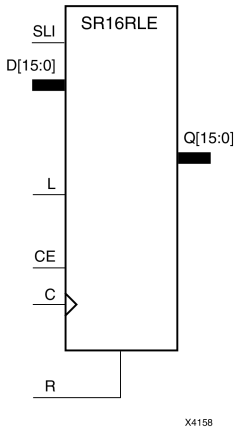
SR16RLE

Macro: 16-Bit Loadable Serial/Parallel-In Parallel-Out Shift Register with Clock Enable and Synchronous Reset



Introduction

This design element is a shift register with shift-left serial input (SLI), parallel inputs (D), parallel outputs (Q), and three control inputs: clock enable (CE), load enable (L), and synchronous reset (R). The register ignores clock transitions when (L) and (CE) are Low. The synchronous (R), when High, overrides all other inputs during the Low-to-High clock (C) transition and resets the data outputs (Q) Low. When (L) is High and (R) is Low during the Low-to-High clock transition, data on the (D) inputs is loaded into the corresponding Q bits of the register.

When (CE) is High and (L) and (R) are Low, data on the (SLI) input is loaded into the first bit of the shift register during the Low-to-High clock (C) transition and appears on the Q0 output. During subsequent clock transitions, when (CE) is High and (L) and (R) are Low, the data shifts to the next highest bit position as new data is loaded into Q0.

Registers can be cascaded by connecting the last Q output of one stage to the SLI input of the next stage and connecting clock, (CE), (L), and (R) inputs in parallel.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs						**Outputs**	
R	**L**	**CE**	**SLI**	**Dz : D0**	**C**	**Q0**	**Qz : Q1**
1	X	X	X	X	↑	0	0
0	1	X	X	Dz : D0	↑	D0	Dn
0	0	1	SLI	X	↑	SLI	qn-1
0	0	0	X	X	X	No Change	No Change
z = bitwidth -1 qn-1 = state of referenced output one setup time prior to active clock transition							

Design Entry Method

This design element is only for use in schematics.

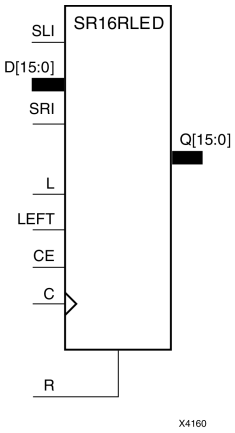
SR16RLED

Macro: 16-Bit Shift Register with Clock Enable and Synchronous Reset



Introduction

This design element is a shift register with shift-left (SLI) and shift-right (SRI) serial inputs, parallel inputs (D), parallel outputs (Q) and four control inputs — clock enable (CE), load enable (L), shift left/right (LEFT), and synchronous reset (R). The register ignores clock transitions when (CE) and (L) are Low. The synchronous (R), when High, overrides all other inputs during the Low-to-High clock (C) transition and resets the data outputs (Q) Low. When (L) is High and (R) is Low during the Low-to-High clock transition, the data on the (D) inputs is loaded into the corresponding (Q) bits of the register.

When (CE) is High and (L) and (R) are Low, data shifts right or left, depending on the state of the LEFT input. If LEFT is High, data on (SLI) is loaded into (Q0) during the Low-to-High clock transition and shifted left (for example, to Q1 and Q2) during subsequent clock transitions. If LEFT is Low, data on the (SRI) is loaded into the last (Q) output during the Low-to-High clock transition and shifted right) during subsequent clock transitions. The logic tables below indicates the state of the (Q) outputs under all input conditions.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

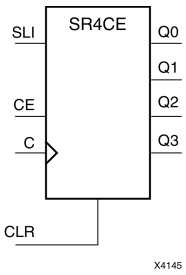
Macro: 4-Bit Serial-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear



Introduction

This design element is a shift register with a shift-left serial input (SLI), parallel outputs (Q), and clock enable (CE) and asynchronous clear (CLR) inputs. The (CLR) input, when High, overrides all other inputs and resets the data outputs (Q) Low. When (CE) is High and (CLR) is Low, the data on the SLI input is loaded into the first bit of the shift register during the Low-to- High clock (C) transition and appears on the (Q0) output. During subsequent Low-to- High clock transitions, when (CE) is High and (CLR) is Low, data shifts to the next highest bit position as new data is loaded into (Q0) (SLI→Q0, Q0→Q1, Q1→Q2, and so forth). The register ignores clock transitions when (CE) is Low.

Registers can be cascaded by connecting the last (Q) output of one stage to the SLI input of the next stage and connecting clock, (CE), and (CLR) in parallel.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs				**Outputs**	
CLR	**CE**	**SLI**	**C**	**Q0**	**Qz : Q1**
1	X	X	X	0	0
0	0	X	X	No Change	No Change

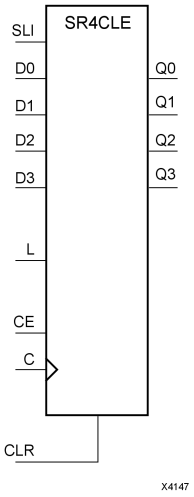
SR4CLE

Macro: 4-Bit Loadable Serial/Parallel-In Parallel-Out Shift Register with Clock Enable and Asynchronous Clear



Introduction

This design element is a shift register with a shift-left serial input (SLI), parallel inputs (D), parallel outputs (Q), and three control inputs: clock enable (CE), load enable (L), and asynchronous clear (CLR) . The register ignores clock transitions when (L) and (CE) are Low. The asynchronous (CLR), when High, overrides all other inputs and resets the data outputs (Q) Low. When (L) is High and (CLR) is Low, data on the Dn -D0 inputs is loaded into the corresponding Qn -(Q0) bits of the register.

When (CE) is High and (L) and (CLR) are Low, data on the SLI input is loaded into the first bit of the shift register during the Low-to-High clock (C) transition and appears on the (Q0) output. During subsequent clock transitions, when (CE) is High and (L) and (CLR) are Low, the data shifts to the next highest bit position as new data is loaded into (Q)0 (for example, SLI→Q0, Q0→Q1, and Q1→Q2).

Registers can be cascaded by connecting the last (Q) output of one stage to the SLI input of the next stage and connecting clock, (CE), (L), and (CLR) inputs in parallel.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

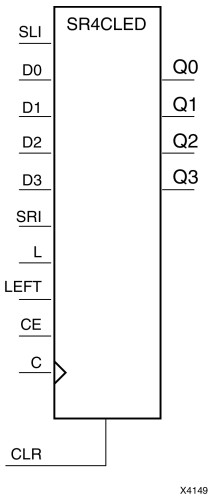
SR4CLED

Macro: 4-Bit Shift Register with Clock Enable and Asynchronous Clear



Introduction

This design element is a shift register with shift-left (SLI) and shift-right (SRI) serial inputs, parallel inputs (D), parallel outputs (Q), and four control inputs: clock enable (CE), load enable (L), shift left/right (LEFT), and asynchronous clear (CLR). The register ignores clock transitions when (CE) and (L) are Low. The asynchronous clear, when High, overrides all other inputs and resets the data outputs (Qn) Low.

When (L) is High and (CLR) is Low, the data on the (D) inputs is loaded into the corresponding (Q) bits of the register. When (CE) is High and (L) and (CLR) are Low, data is shifted right or left, depending on the state of the LEFT input. If LEFT is High, data on the SLI is loaded into (Q0) during the Low-to-High clock transition and shifted left (for example, to Q1 or Q2) during subsequent clock transitions. If LEFT is Low, data on the SRI is loaded into the last (Q) output during the Low-to-High clock transition and shifted right during subsequent clock transitions. The logic tables indicate the state of the (Q) outputs under all input conditions.

This register is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the appropriate STARTUP_*architecture* symbol.

Logic Table

Inputs								Outputs

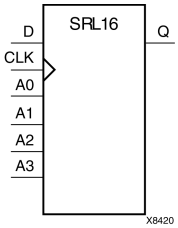
SRL16

Primitive: 16-Bit Shift Register Look-Up Table (LUT)



Introduction

This design element is a shift register look-up table (LUT). The inputs A3, A2, A1, and A0 select the output length of the shift register.

The shift register can be of a fixed, static length or it can be dynamically adjusted.

- **To create a fixed-length shift register -**Drive the A3 through A0 inputs with static values. The length of the shift register can vary from 1 bit to 16 bits, as determined by the following formula: Length = (8 x A3) +(4 x A2) + (2 x A1) + A0 +1 If A3, A2, A1, and A0 are all zeros (0000), the shift register is one bit long. If they are all ones (1111), it is 16 bits long.
- **To change the length of the shift register dynamically -**Change the values driving the A3 through A0 inputs. For example, if A2, A1, and A0 are all ones (111) and A3 toggles between a one (1) and a zero (0), the length of the shift register changes from 16 bits to 8 bits. Internally, the length of the shift register is always 16 bits and the input lines A3 through A0 select which of the 16 bits reach the output.

The shift register LUT contents are initialized by assigning a four-digit hexadecimal number to an INIT attribute. The first, or the left-most, hexadecimal digit is the most significant bit. If an INIT value is not specified, it defaults to a value of four zeros (0000) so that the shift register LUT is cleared during configuration.

The data (D) is loaded into the first bit of the shift register during the Low-to-High clock (CLK) transition. During subsequent Low-to-High clock transitions data shifts to the next highest bit position while new data is loaded. The data appears on the Q output when the shift register length determined by the address inputs is reached.

Logic Table

Inputs			**Output**
Am	**CLK**	**D**	**Q**
Am	X	X	Q(Am)
Am	↑	D	Q(Am - 1)
m= 0, 1, 2, 3			

Design Entry Method

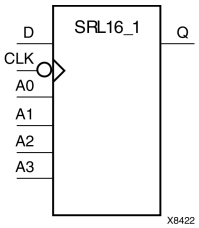
SRL16_1

Primitive: 16-Bit Shift Register Look-Up Table (LUT) with Negative-Edge Clock



Introduction

This design element is a shift register look-up table (LUT). The inputs A3, A2, A1, and A0 select the output length of the shift register.

The shift register can be of a fixed, static length or it can be dynamically adjusted.

- **To create a fixed-length shift register -**Drive the A3 through A0 inputs with static values. The length of the shift register can vary from 1 bit to 16 bits, as determined by the following formula: Length = (8 x A3) +(4 x A2) + (2 x A1) + A0 +1 If A3, A2, A1, and A0 are all zeros (0000), the shift register is one bit long. If they are all ones (1111), it is 16 bits long.
- **To change the length of the shift register dynamically -**Change the values driving the A3 through A0 inputs. For example, if A2, A1, and A0 are all ones (111) and A3 toggles between a one (1) and a zero (0), the length of the shift register changes from 16 bits to 8 bits. Internally, the length of the shift register is always 16 bits and the input lines A3 through A0 select which of the 16 bits reach the output.

The shift register LUT contents are initialized by assigning a four-digit hexadecimal number to an INIT attribute. The first, or the left-most, hexadecimal digit is the most significant bit. If an INIT value is not specified, it defaults to a value of four zeros (0000) so that the shift register LUT is cleared during configuration.

The data (D) is loaded into the first bit of the shift register during the High-to-Low clock (CLK) transition. During subsequent High-to-Low clock transitions data shifts to the next highest bit position as new data is loaded. The data appears on the Q output when the shift register length determined by the address inputs is reached.

Logic Table

Inputs			Output
Am	**CLK**	**D**	**Q**
Am	X	X	Q(Am)
Am	↓	D	Q(Am - 1)
m= 0, 1, 2, 3			

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Hexadecimal	Any 16-Bit Value	All zeros	Sets the initial value of Q output after configuration

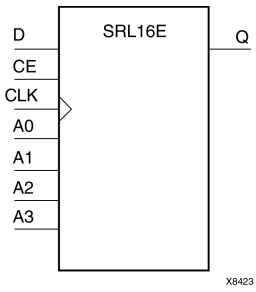
Primitive: 16-Bit Shift Register Look-Up Table (LUT) with Clock Enable



Introduction

This design element is a shift register look-up table (LUT). The inputs A3, A2, A1, and A0 select the output length of the shift register.

The shift register can be of a fixed, static length or it can be dynamically adjusted.

- **To create a fixed-length shift register -**Drive the A3 through A0 inputs with static values. The length of the shift register can vary from 1 bit to 16 bits, as determined by the following formula: Length = (8 x A3) +(4 x A2) + (2 x A1) + A0 +1 If A3, A2, A1, and A0 are all zeros (0000), the shift register is one bit long. If they are all ones (1111), it is 16 bits long.
- **To change the length of the shift register dynamically -**Change the values driving the A3 through A0 inputs. For example, if A2, A1, and A0 are all ones (111) and A3 toggles between a one (1) and a zero (0), the length of the shift register changes from 16 bits to 8 bits. Internally, the length of the shift register is always 16 bits and the input lines A3 through A0 select which of the 16 bits reach the output.

The shift register LUT contents are initialized by assigning a four-digit hexadecimal number to an INIT attribute. The first, or the left-most, hexadecimal digit is the most significant bit. If an INIT value is not specified, it defaults to a value of four zeros (0000) so that the shift register LUT is cleared during configuration.

When CE is High, the data (D) is loaded into the first bit of the shift register during the Low-to-High clock (CLK) transition. During subsequent Low-to-High clock transitions, when CE is High, data shifts to the next highest bit position as new data is loaded. The data appears on the Q output when the shift register length determined by the address inputs is reached. When CE is Low, the register ignores clock transitions.

Logic Table

Inputs				Output
Am	**CE**	**CLK**	**D**	**Q**
Am	0	X	X	Q(Am)
Am	1	↑	D	Q(Am - 1)
m= 0, 1, 2, 3				

Port Descriptions

Port	Direction	Width	Function
Q	Output	1	Shift register data output
D	Input	1	Shift register data input
CLK	Input	1	Clock
CE	Input	1	Active high clock enable
A	Input	4	Dynamic depth selection of the SRL • A=0000 ==> 1-bit shift length • A=1111 ==> 16-bit shift length

Design Entry Method

This design element can be used in schematics.

Available Attributes

Attribute	Type	Allowed Values	Default	Description
INIT	Hexa-decimal	Any 16-Bit Value	All zeros	Sets the initial value of content and output of shift register after configuration.

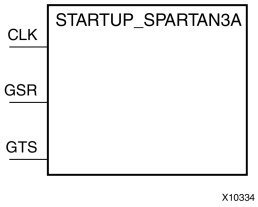
STARTUP_SPARTAN3A

Primitive: Spartan®-3A Global Set/Reset, Global 3-State and Configuration Start-Up Clock Interface



Introduction

This design element is used to either interface device pins and logic to the Global Set/Reset (GSR) signal, or for Global Tristate (GTS) dedicated routing. This primitive can also be used to specify a different clock for the device startup sequence at the end of configuring the device.

Port Descriptions

Port	Direction	Width	Function
GSR	Input	1	Input connection to the global set / reset (GSR) routing.
GTS	Input	1	Input connection to the global 3-state (GTS) routing.
CLK	Input	1	Input connection to the configuration startup sequence clock (GSR) routing.

Design Entry Method

This design element can be used in schematics.

To use the dedicated GSR circuitry, connect the sourcing pin or logic to the GSR pin. However, avoid using the GSR circuitry of this component unless certain precautions are taken first. Since the skew of the GSR net cannot be guaranteed, either use general routing for the set/reset signal in which routing delays and skew can be calculated as a part of the timing analysis of the design or to take preventative measures to ensure that possible skew on the release of the clock cycle won't interfere with circuit operation.

Similarly, if the dedicated global 3-state is used, connect the appropriate sourcing pin or logic to the GTS input pin of the primitive. In order to specify a clock for the startup sequence of configuration, connect a clock from the design to the CLK pin of this design element.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

VCC

Primitive: VCC-Connection Signal Tag

Introduction

This design element serves as a signal tag, or parameter, that forces a net or input function to a logic High level. A net tied to this element cannot have any other source.

When the placement and routing software encounters a net or input function tied to this element, it removes any logic that is disabled by the Vcc signal, which is only implemented when the disabled logic cannot be removed.

Design Entry Method

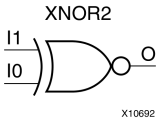
This design element is only for use in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

XNOR2

Primitive: 2-Input XNOR Gate with Non-Inverted Inputs



Introduction

XNOR functions of up to nine inputs are available. All inputs are non-inverting. Because each input uses a CLB resource, replace functions with unused inputs with functions having the necessary number of inputs.

Logic Table

Input	Output
I0 ... Iz	O
Odd number of 1	0
Even number of 1	1

Design Entry Method

This design element is only for use in schematics.

For More Information

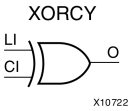
XORCY

Primitive: XOR for Carry Logic with General Output



Introduction

This design element is a special XOR with general O output that generates faster and smaller arithmetic functions. The XORCY primitive is a dedicated XOR function within the carry-chain logic of the slice. It allows for fast and efficient creation of arithmetic (add/subtract) or wide logic functions (large AND/OR gate).

Logic Table

Input		Output
LI	**CI**	**O**
0	0	0
0	1	1
1	0	1
1	1	0

Design Entry Method

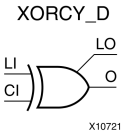
This design element can be used in schematics.

For More Information

- See the *Spartan-3 Generation FPGA User Guide*.
- See the *Spartan-3A FPGA Family Data Sheet*.

XORCY_D

Primitive: XOR for Carry Logic with Dual Output



Introduction

This design element is a special XOR that generates faster and smaller arithmetic functions.

Logic Table

Input		Output
